

Lecture 2

CATCH UP:

SciViz and DataViZ

VS (contained in)

InfoViz

SCIVIS or DATAVIS:

visualize empirical/scientific data, or real data to be seen (observed, analized, unerstood, perceived)

- presents results, tells a data story
- allows exploring data,
- Understand the data (making hypothesis, verifying hypothesis, dempnstrating them, thus demonstrating a thesis)
- uses well known techniques: tabs, graphs, maps, plots, ...
- Must choose
 - Best = most representative/well represented data
 - Proper (already existing) visualization method

INFOVIS/ INFOGRAPHIC (INFORMATION + DATA)

- Allows to
 - show results and tell stories, by reporting key findings
 - make comparisons
 - present a timeline story
 - advertisement
 - give instructions, explain processes
 - call to action
 - simplify complex data, resume a complex story
- It builds/disCOVERS/finds out the best visualization methods making up novel ones
- Jointly exploits art and scivis methods

INTERACTIVE and DYNAMIC

or

STATIC?

VISUALIZATION (both InfoViz and SciViz): INTERACTIVE OR STATIC?

A static visualization depicts a data story, a result that you want to explain to others.
The result does not change in time.

An interactive graphic tells a different story each time new data is automatically or manually inserted.
It is dynamic (automatic dynamic update o manual update)

Most often used by visual analytics and business intelligence tools

INTERACTIVE <https://www.nasdaq.com/>

STATIC <https://www.nasdaq.com/articles/when-performance-matters%3A-nasdaq-100-vs.-sp-500-2019-07-22>

The S&P 500, or just the S&P, is a stock market index that measures the stock performance of 500 large companies listed on stock exchanges in the United States. It is one of the most commonly followed equity indices, and many consider it to be one of the best representations of the U.S. stock market

Interaction techniques

are particularly useful for allowing dynamic exploration of large scale datasets, eventually showing interaction between points in the dataset.

- overview+detail [1] techniques provide users with a coarse overview of the dataset structure and allow detailed views of portions of the dataset on demand. Do not distort data but allowing zooming back and forth.
- Focus+context [2] techniques aim at integrating both, detailed views (focus) and overview (context). Examples: fish-eyes views, distorted views (logarithmic views)

[1] B. Shneiderman, "The eyes have it: a task by data type taxonomy for information visualizations," Proceedings 1996 IEEE Symposium on Visual Languages, Boulder, CO, USA, 1996, pp. 336-343. doi: 10.1109/VL.1996.545307. URL: <http://ieeexplore.ieee.org/stamp/stamp.jsp?tp=&arnumber=545307&isnumber=11360>.

[2] Y. K. Leung and M. D. Apperley. 1994. [A review and taxonomy of distortion-oriented presentation techniques](#). ACM Trans. Comput.-Hum. Interact. 1, 2 (June 1994), 126-160. DOI:<https://doi.org/10.1145/180171.180173>

Design and evaluation

Some works concentrate on the design and evaluation of interactive visualization tools. Both design and evaluation must comprise:

Task abstraction studies: the task must be viewed at a higher, abstract level.

Human Computer interaction (HCI) studies: focus on the user needs, to design proper computerized systems by particularly focusing in
the **interaction between humans** (the users) and computers.

User-centered design (UCD) studies: interactive **design** process in which designers focus on the **users** and their needs in each phase of the **design** process.

When the dynamic process regards environmental data, maps are used.

One of the mostly viewed interactive dashboards in February/March 2020:

WHERE DID GRAPHS/TABLES/PLOTS COME FROM?

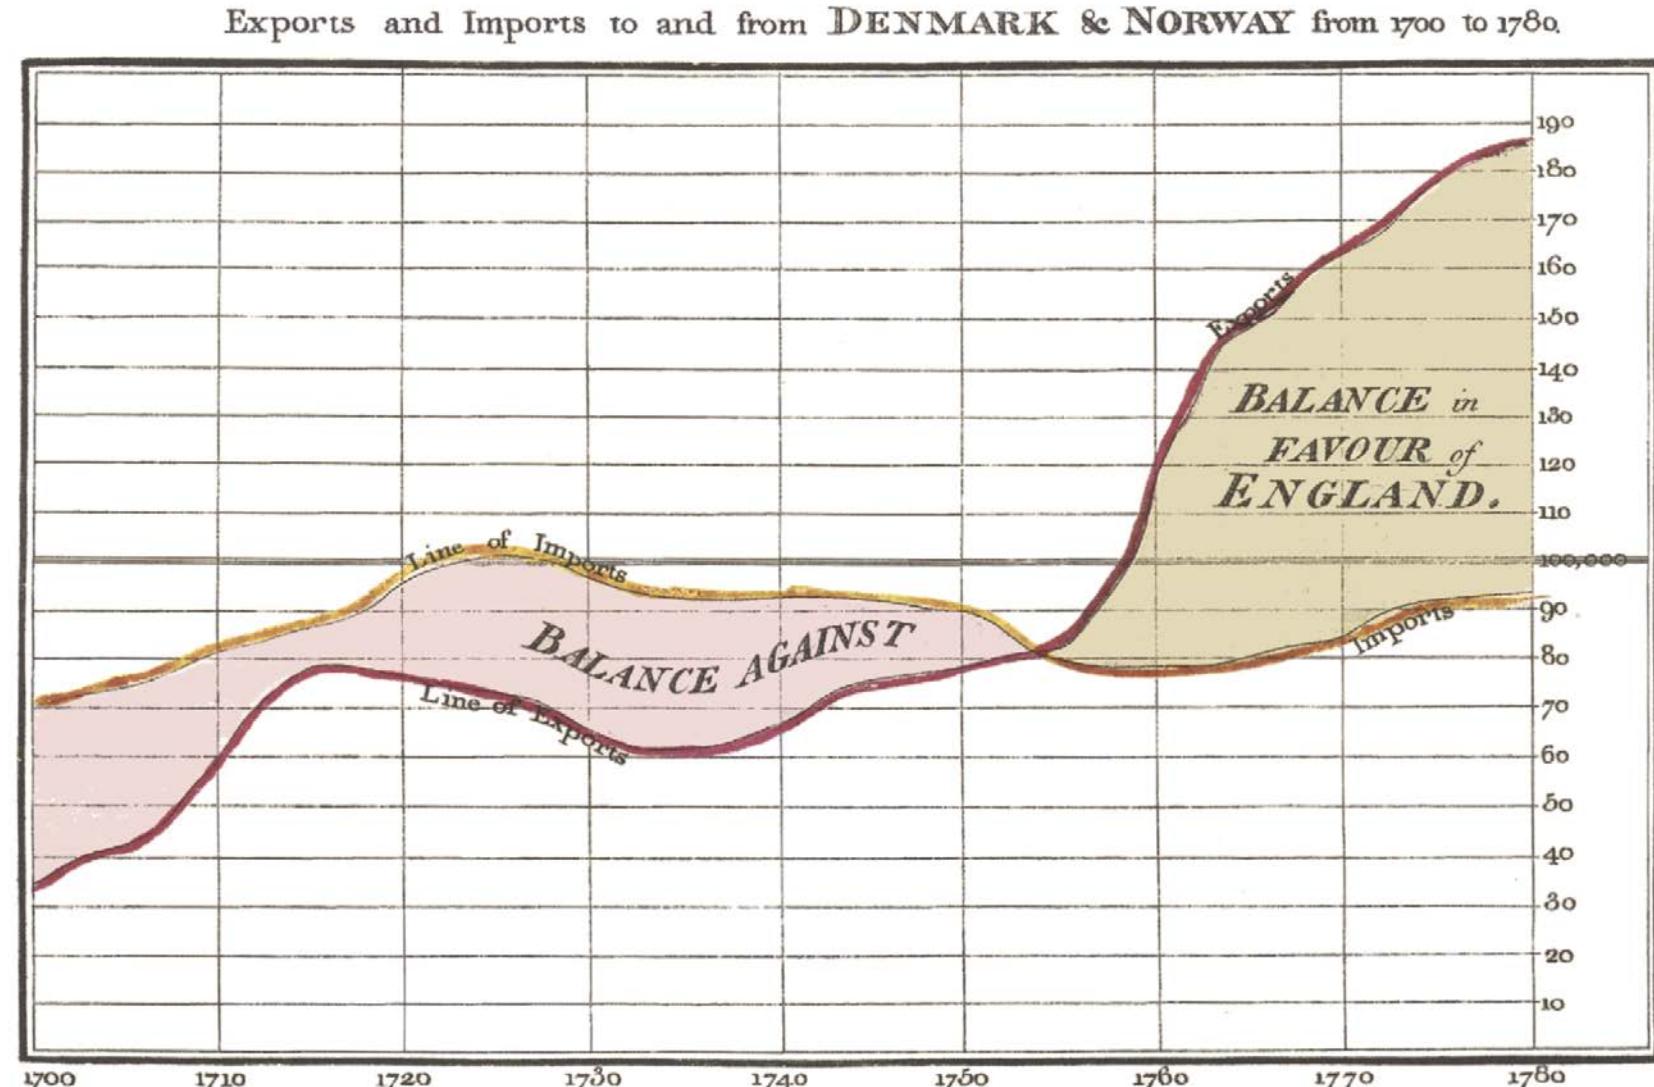

A Brief History of Data Visualization

Michael Friendly

Life before EXCEL: some historical statistical graphs

1786. William Playfair "Commercial and political Atlas"

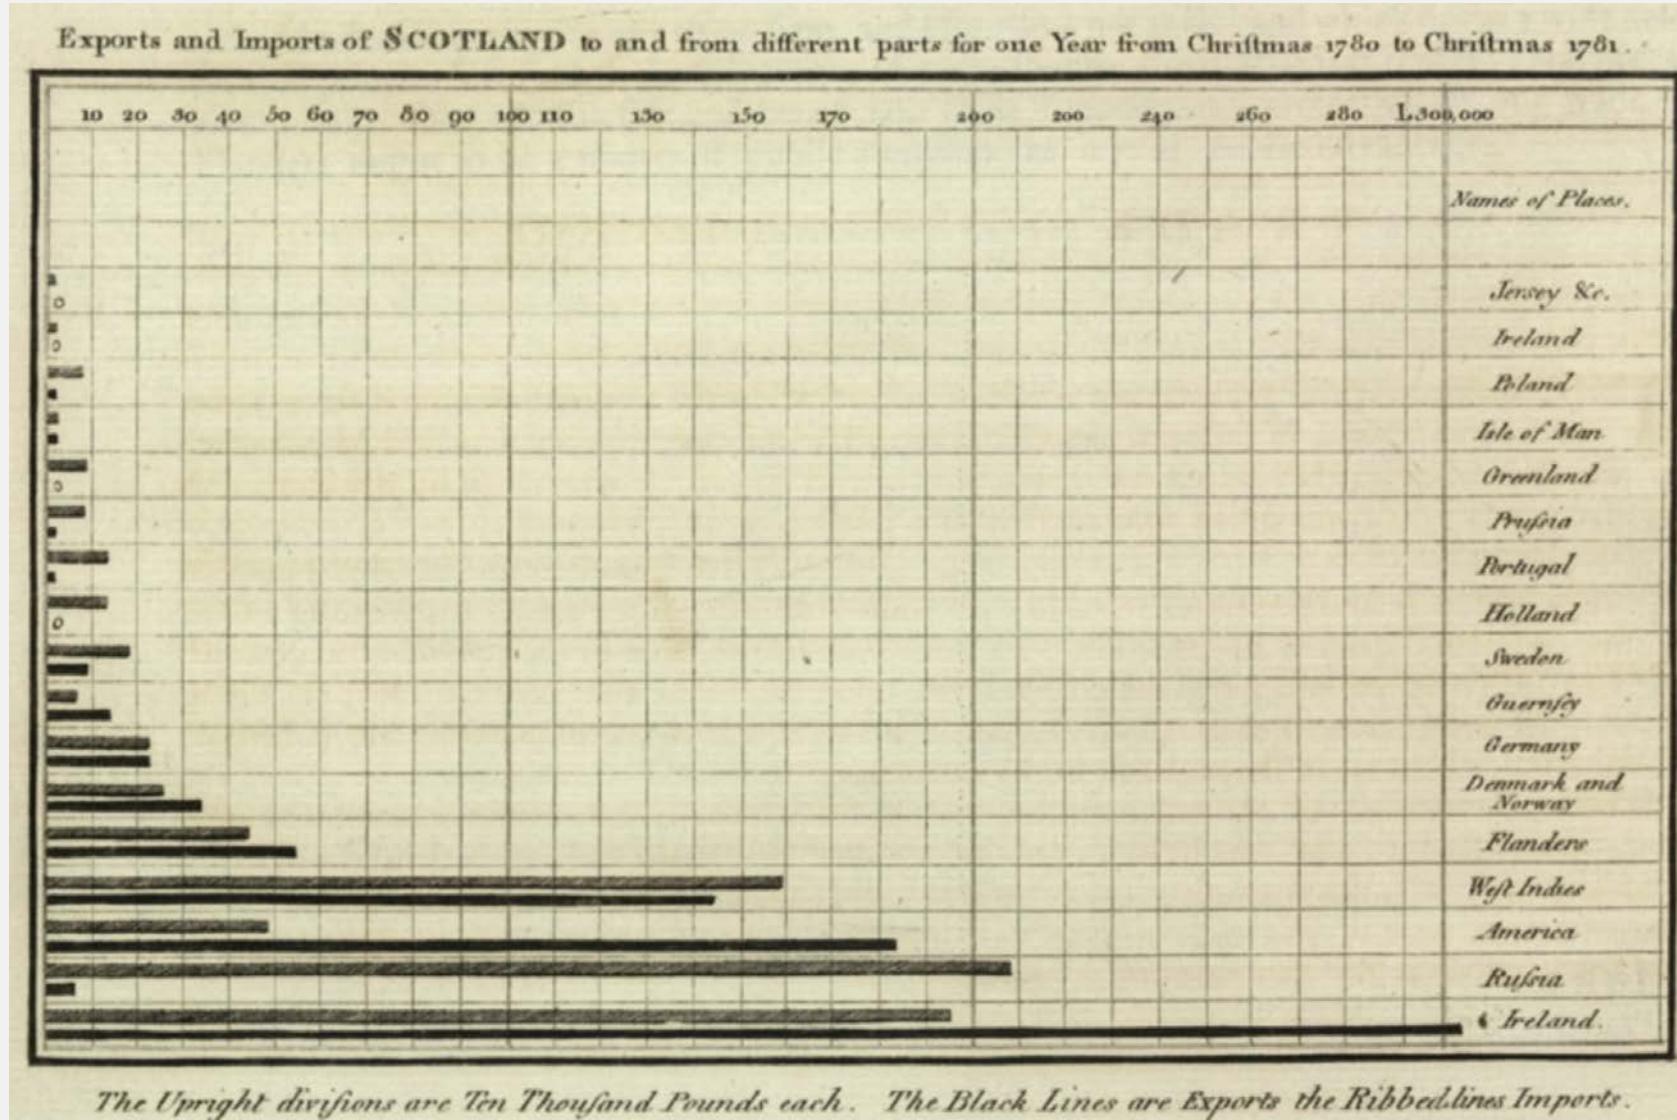

The Bottom line is divided into Years, the Right hand line into £10,000 each.

Published as the Act directs, 1st May 1786, by W^m. Playfair

Neale sculpt 352, Strand, London.

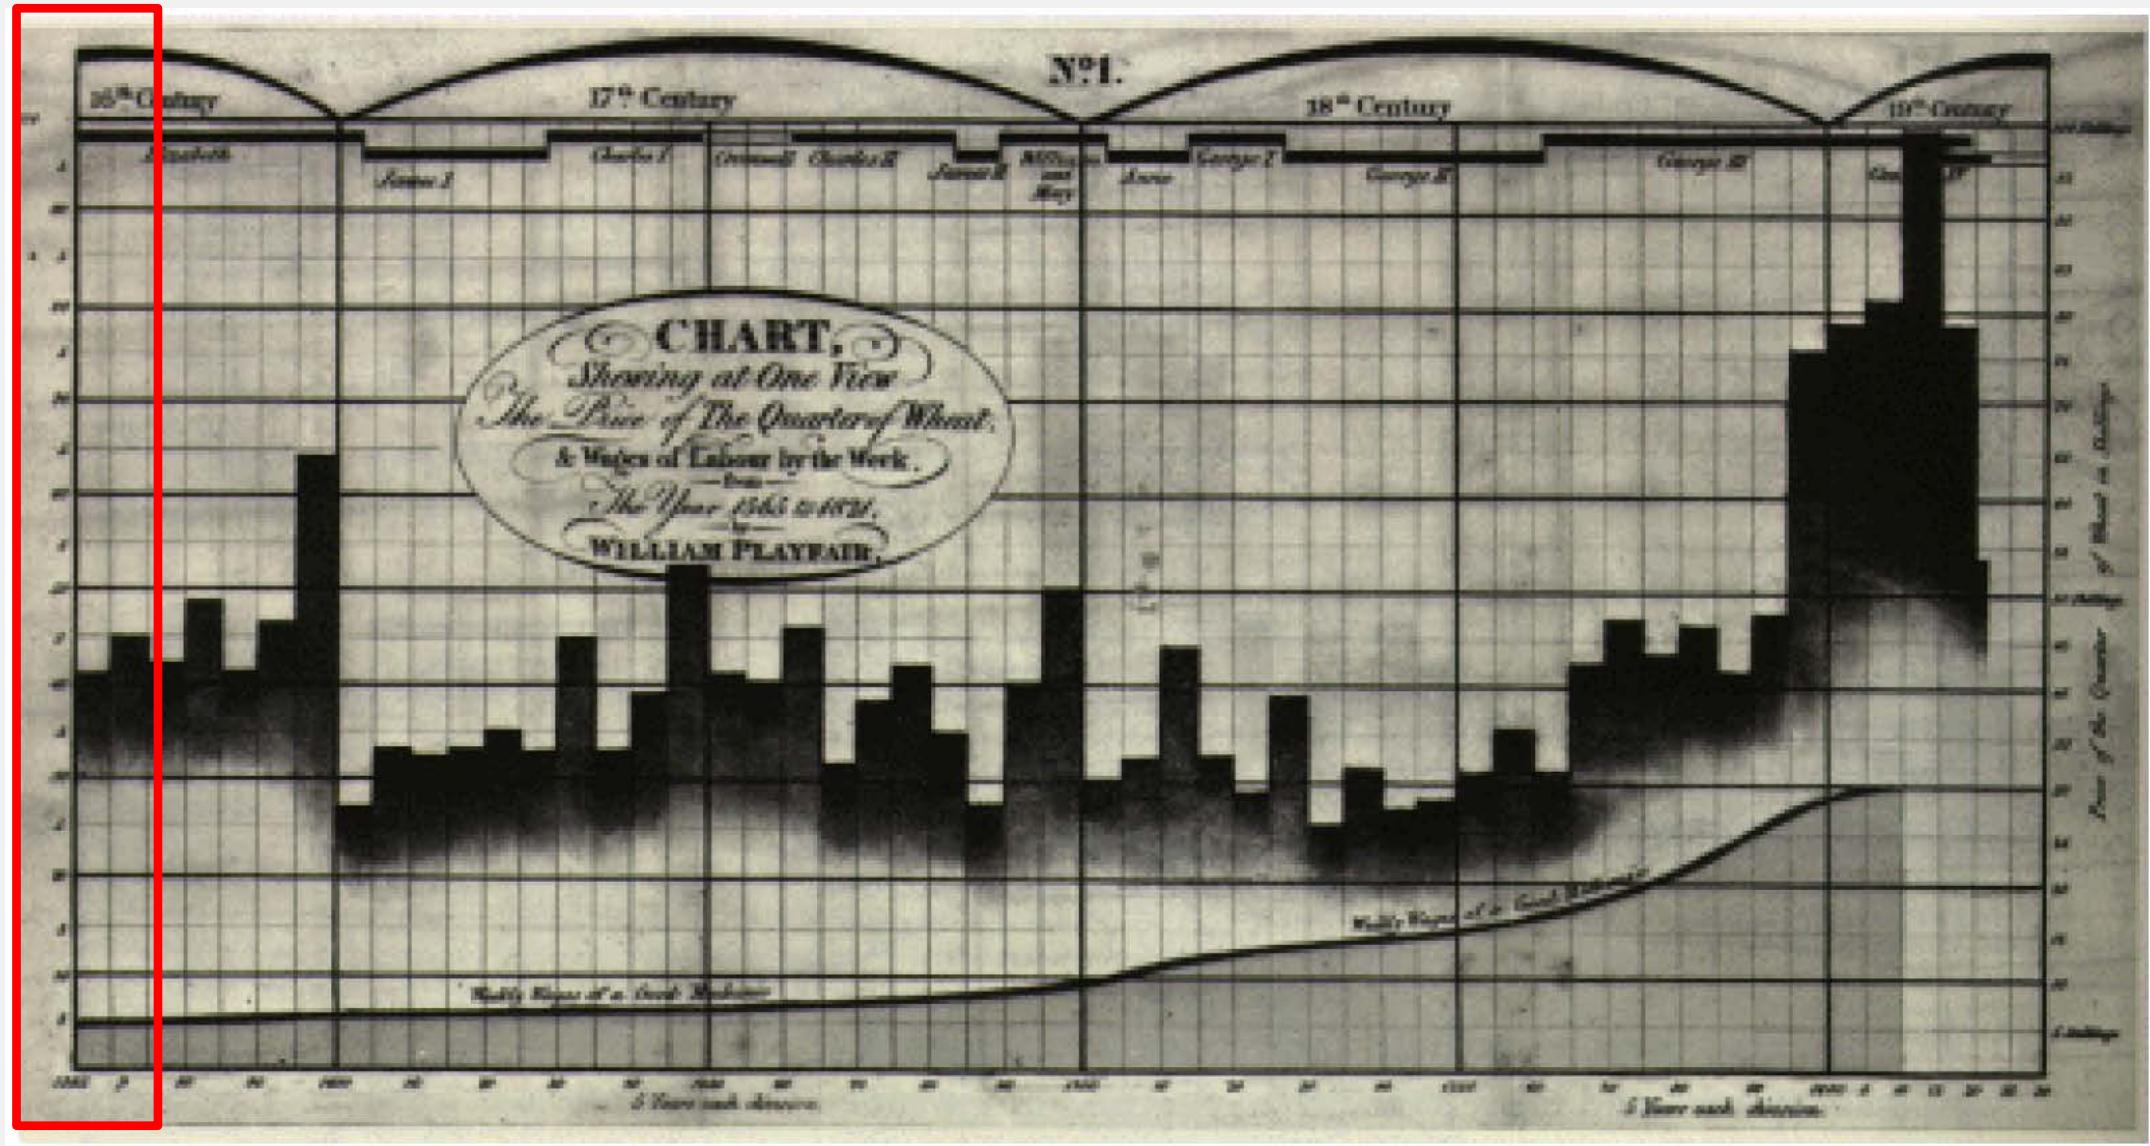

THE FIRST BAR CHART (it's horizontal: Playfair already knew and considered psychological principles)

PLAYFAIR ALSO INTRODUCED THE USAGE OF SUPERIMPOSED GRAPHS (TWO AXIS)

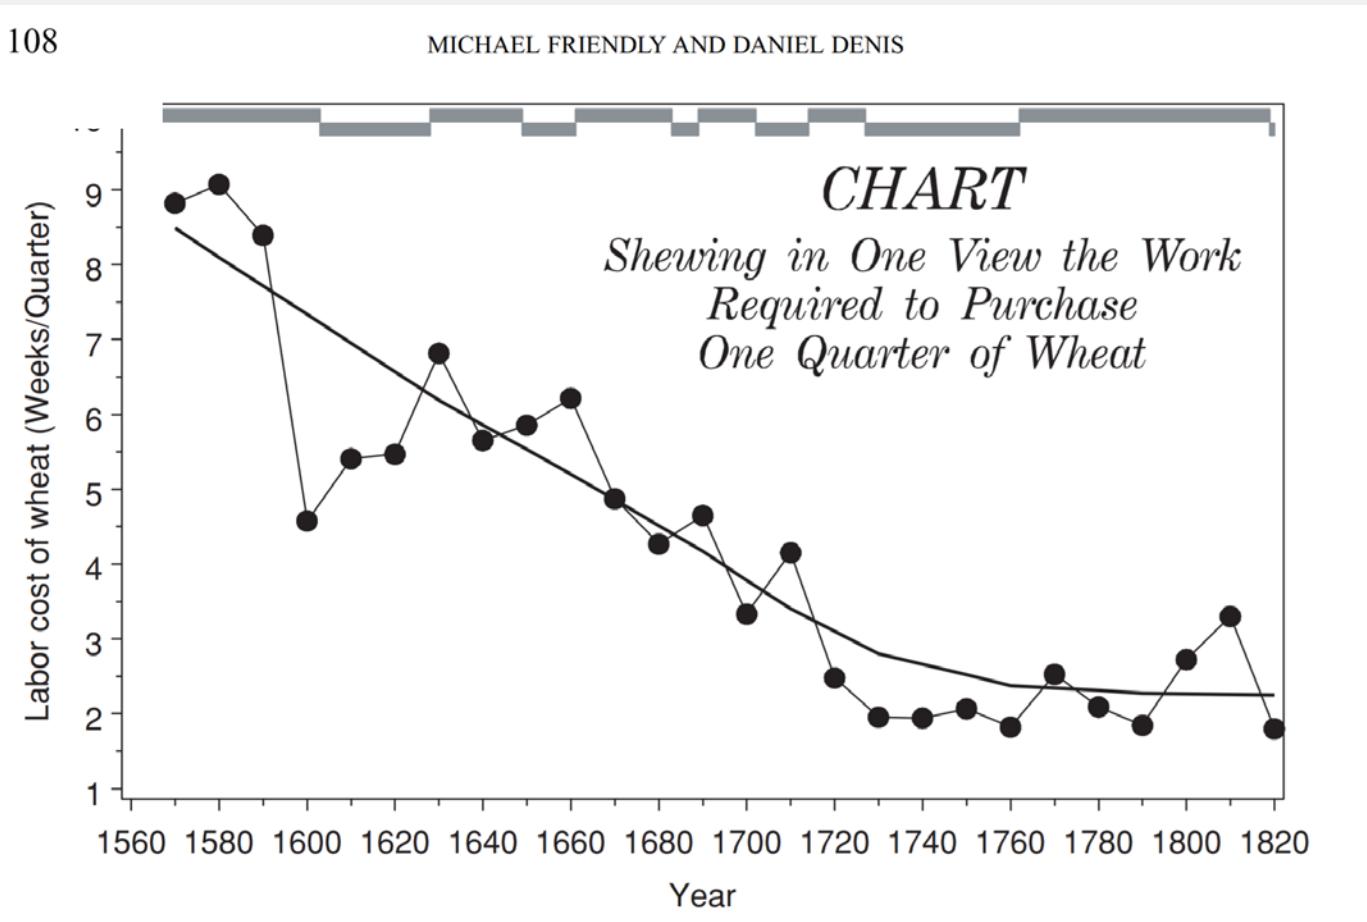

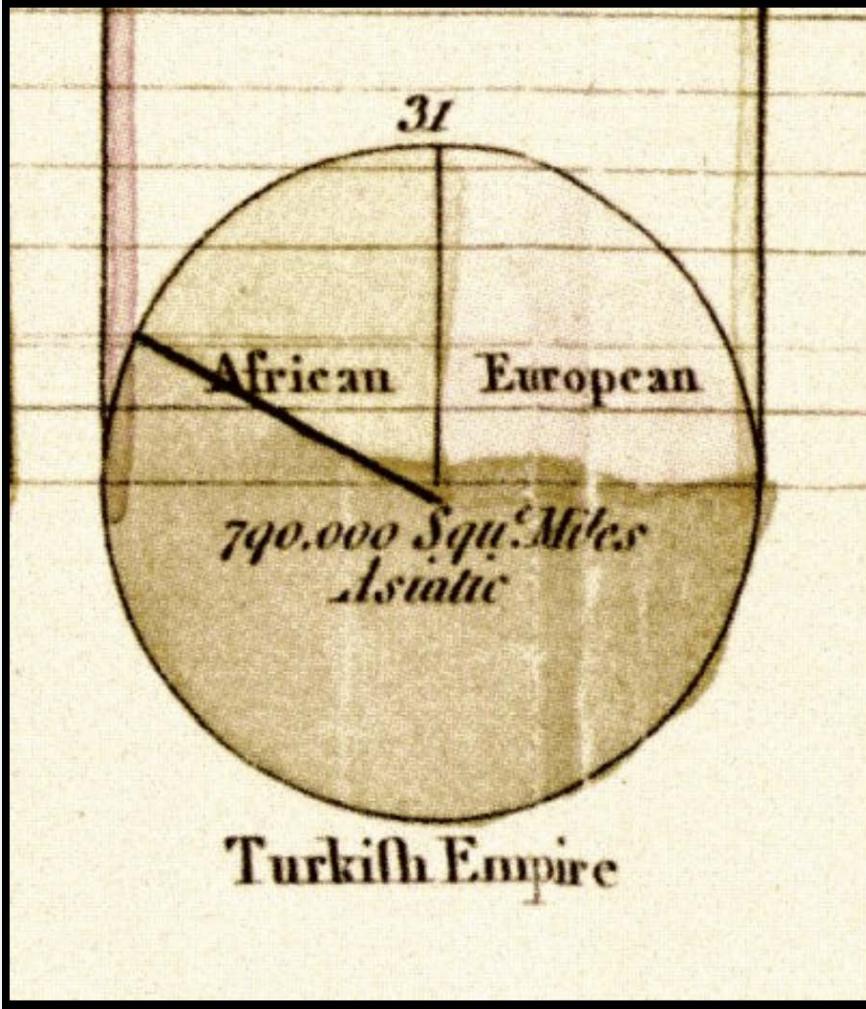

Playfair used three parallel time series (differently represented) to show
the price of wheat (bar-chart)
weekly wages (line-chart)
and reigning monarch (top squared boxed line)
from 1565 to 1821, and used this graph to argue that workers had become better off in the
most recent years.

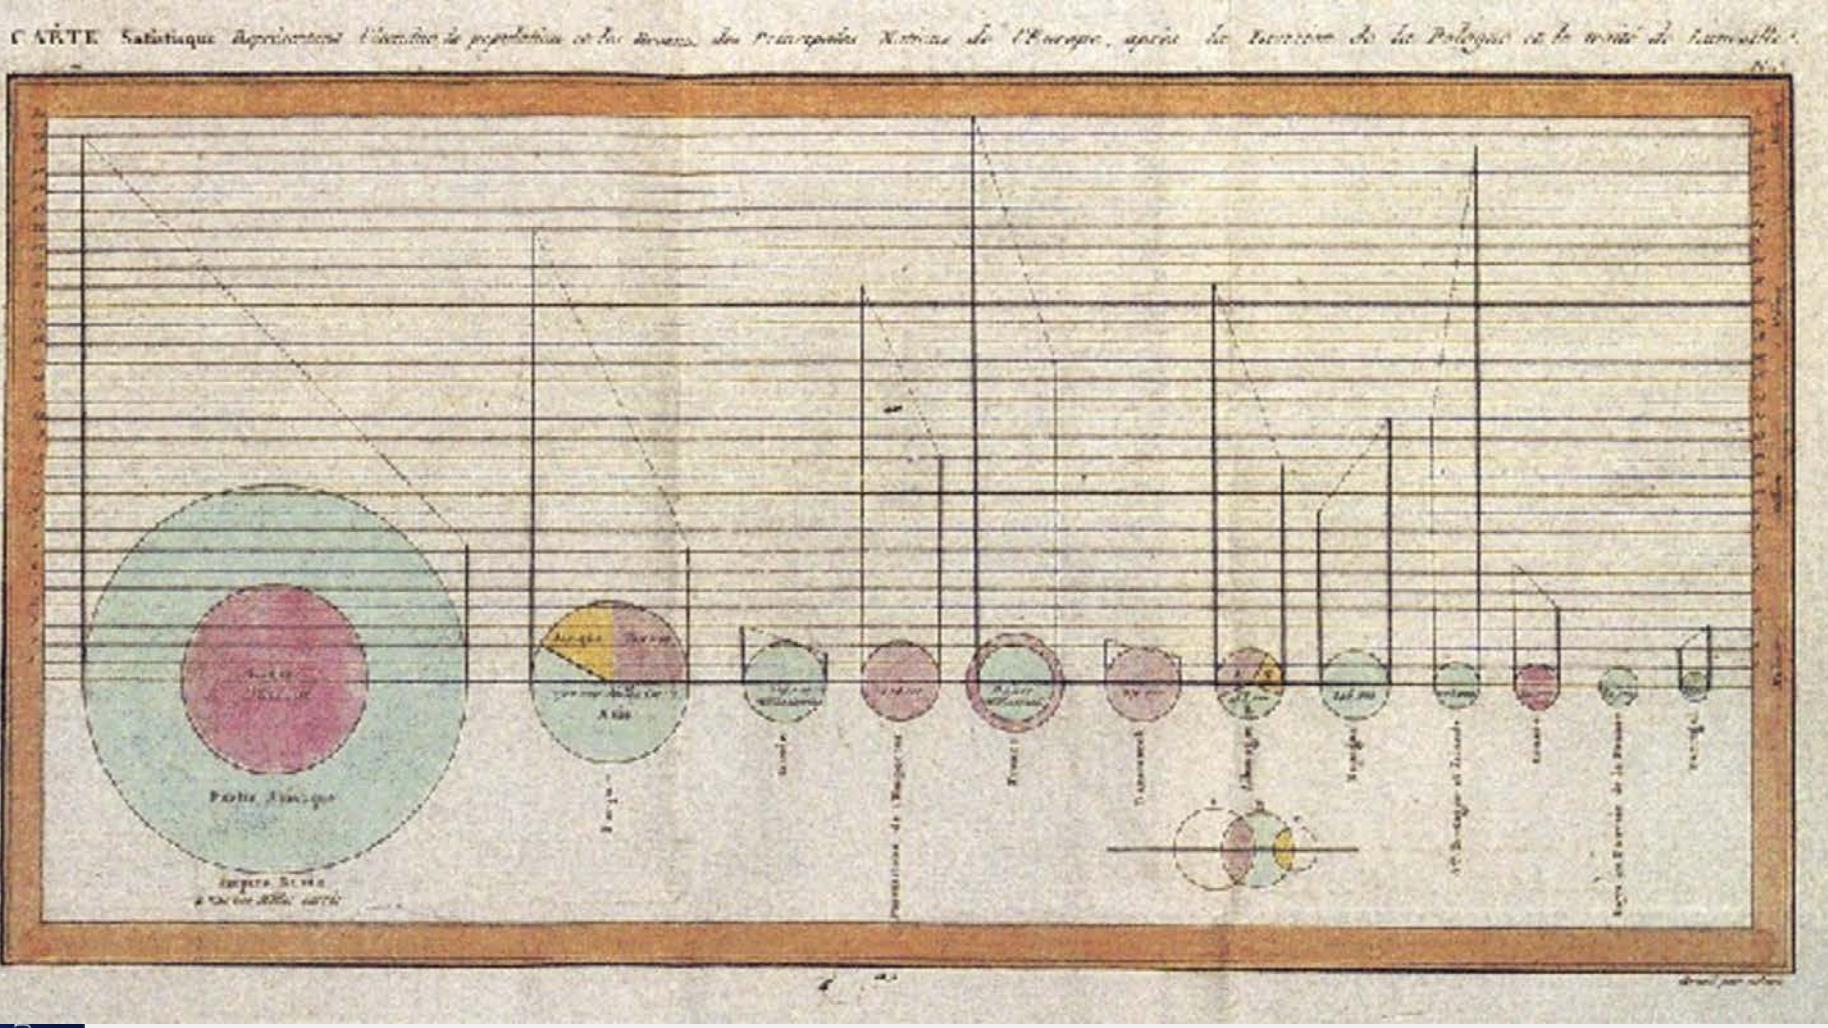

That this conclusion was correct can be seen clearly from the modern (2006) redrawing of the graph by [Michael Friendly and Howard Wainer](#).

“ratio of price of wheat to wages, representing the labor cost of wheat, as shown in the Figure 4 (on the left). We also felt an irresistible impulse to add a statistically smoothed curve to this plot. “

[Pie chart](#) from Playfair's *Statistical Breviary* (1801),
showing the proportions of the [Turkish Empire](#) located in
Asia, Europe and Africa before 1789

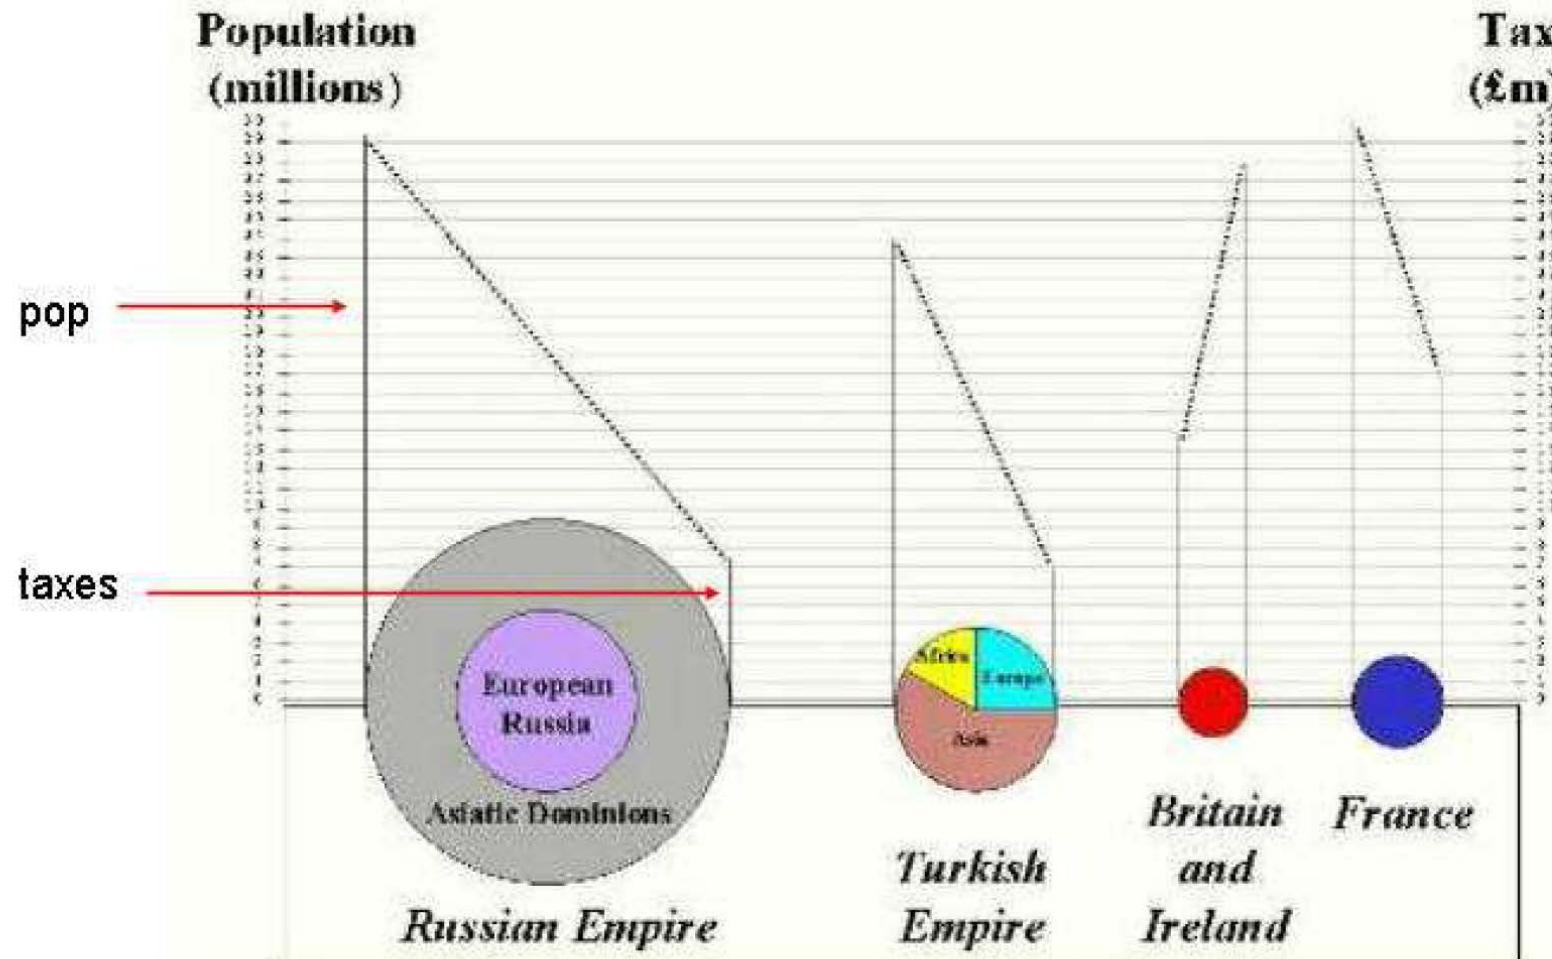

Pie charts from William Playfair's "Statistical Breviary", 1801.

He loved circles.
In this graphs compares population (left vertical line) and taxes (right vertical line) in several nations.

Re-drawn version of a portion of Playfair's 1801 pie-circle-line chart

Use of two separate vertical scales for different quantities (population and taxes).

Tries to directly compare population and taxes and argue that the British were overtaxed, compared with others.

In this figure the left axis and line on each circle/pie graph shows population, while the right axis and line shows taxes.

Playfair intended that the *slope* of the line connecting the two would depict the rate of taxation directly to the eye;

WRONG! The slope also depends on the diameters of the circles (geographical area which has been considered).

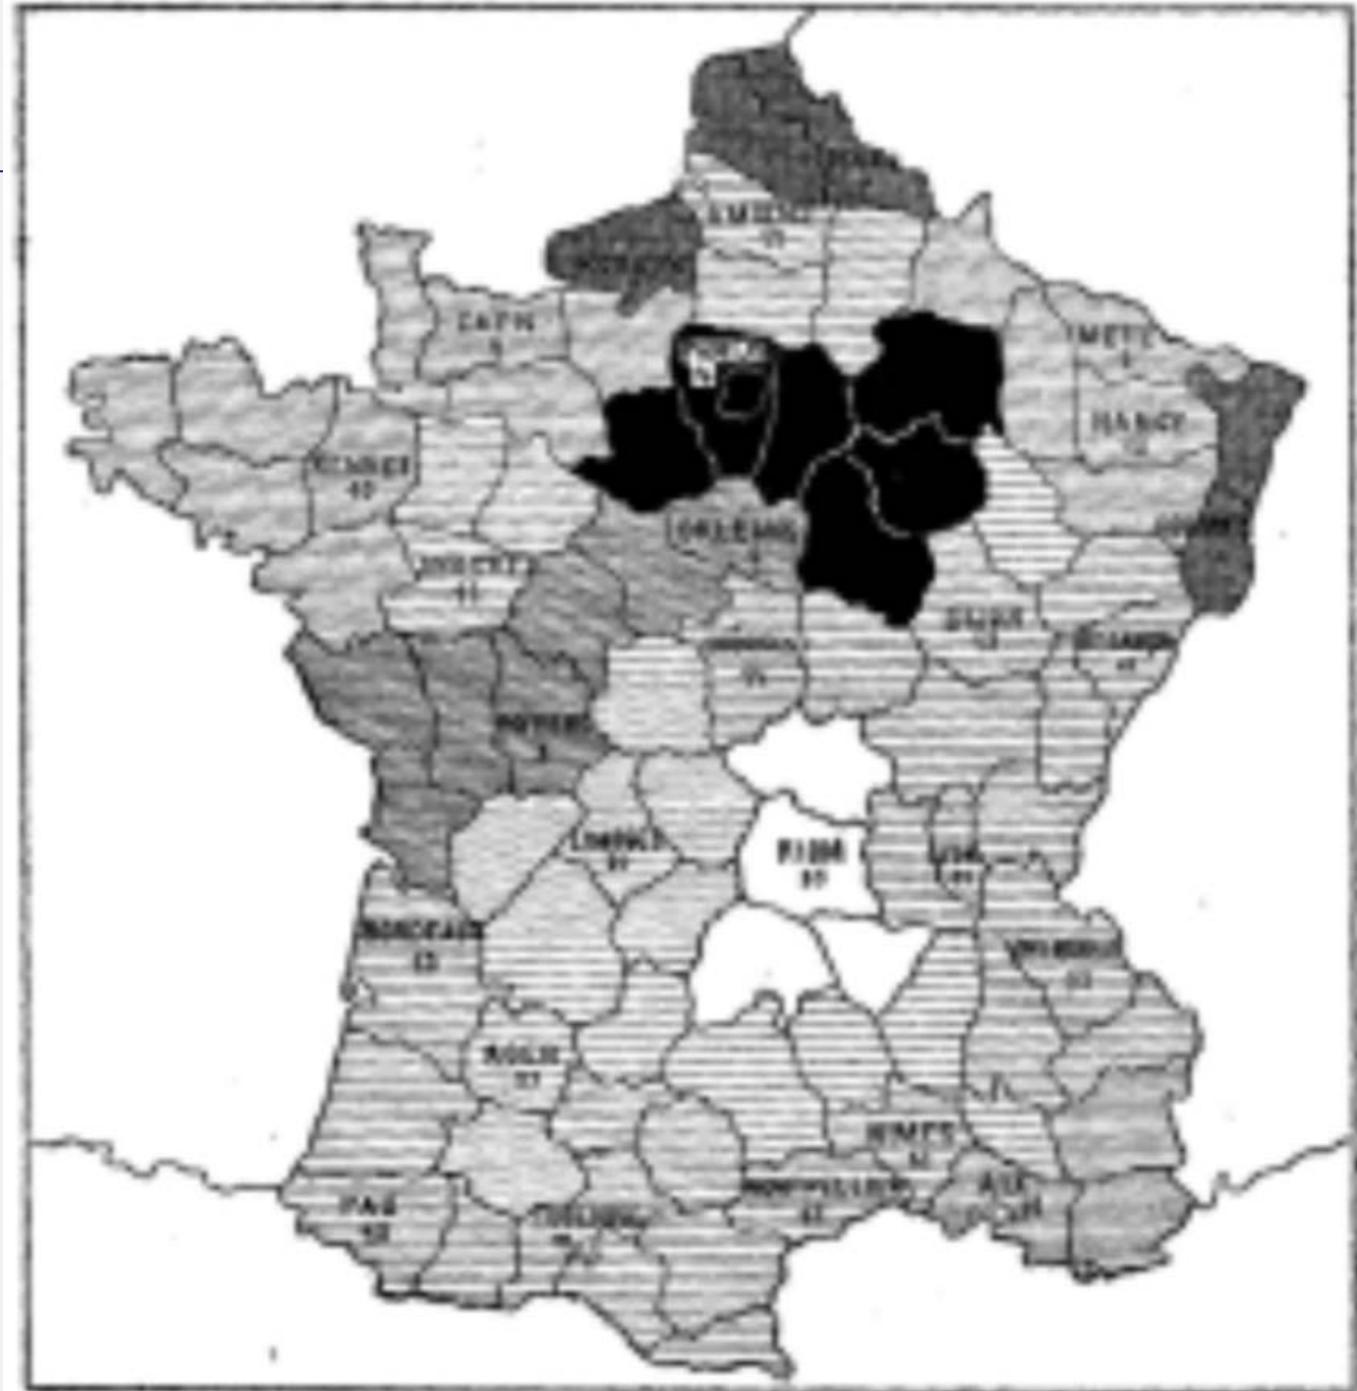

However the direction of the slope is right in telling which country is more taxed.
Britain is in opposite direction with respect to other countries

1826. Baron Pierre Charles Dupin

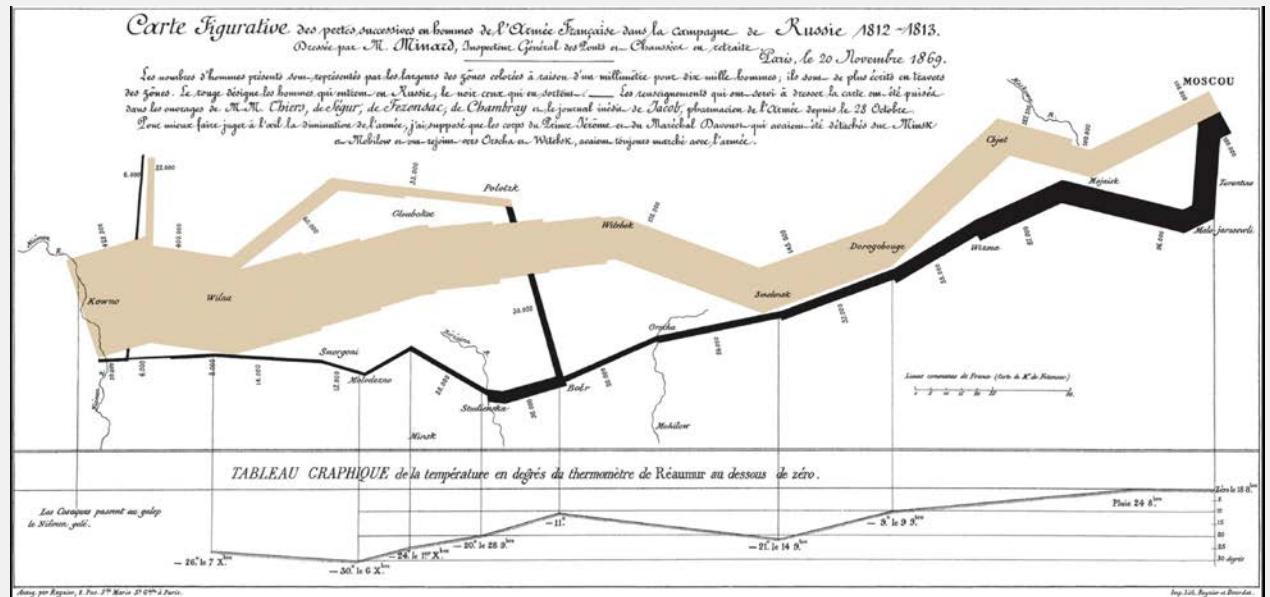

Choropleth map with shadings from black to white (distribution and intensity of illiteracy in France), the first (unclassed) choropleth map, and perhaps the first modern statistical map.

1812. Charles Minard's map of Napoleon's disastrous Russian campaign of 1812.

Represents in 2D six types of data:

- the number of Napoleon's troops;
- distance;
- temperature;
- the latitude and longitude;
- direction of travel;
- and location relative to specific dates.

Carte Figurative des pertes successives en hommes de l'Armée Française dans la Campagne de Russie 1812-1813.

Dessinée par M. Minard, Inspecteur Général des Ponts et Chaussées en retraite
Paris, le 20 Novembre 1869.

Les nombres d'hommes présents sont représentés par les largeurs des zones colorées à raison d'un millimètre pour dix mille hommes; ils sont de plus écrits en travers des zones. Le rouge désigne les hommes qui entrent en Russie, le noir ceux qui en sortent. — Les renseignements qui ont servi à dresser la carte ont été puisés dans les ouvrages de M. M. Chiers, de Séguir, de Fezensac, de Chambray et le journal médical de Jacob, pharmacien de l'Armée depuis le 28 Octobre.

Pour mieux faire juger à l'œil la diminution de l'armée, j'ai supposé que les corps du Prince Jérôme et du Maréchal Davout, qui avaient été détachés sur Minsk et Mogilow et se rejoignaient vers Orscha et Witebsk, avaient toujours marché avec l'armée.

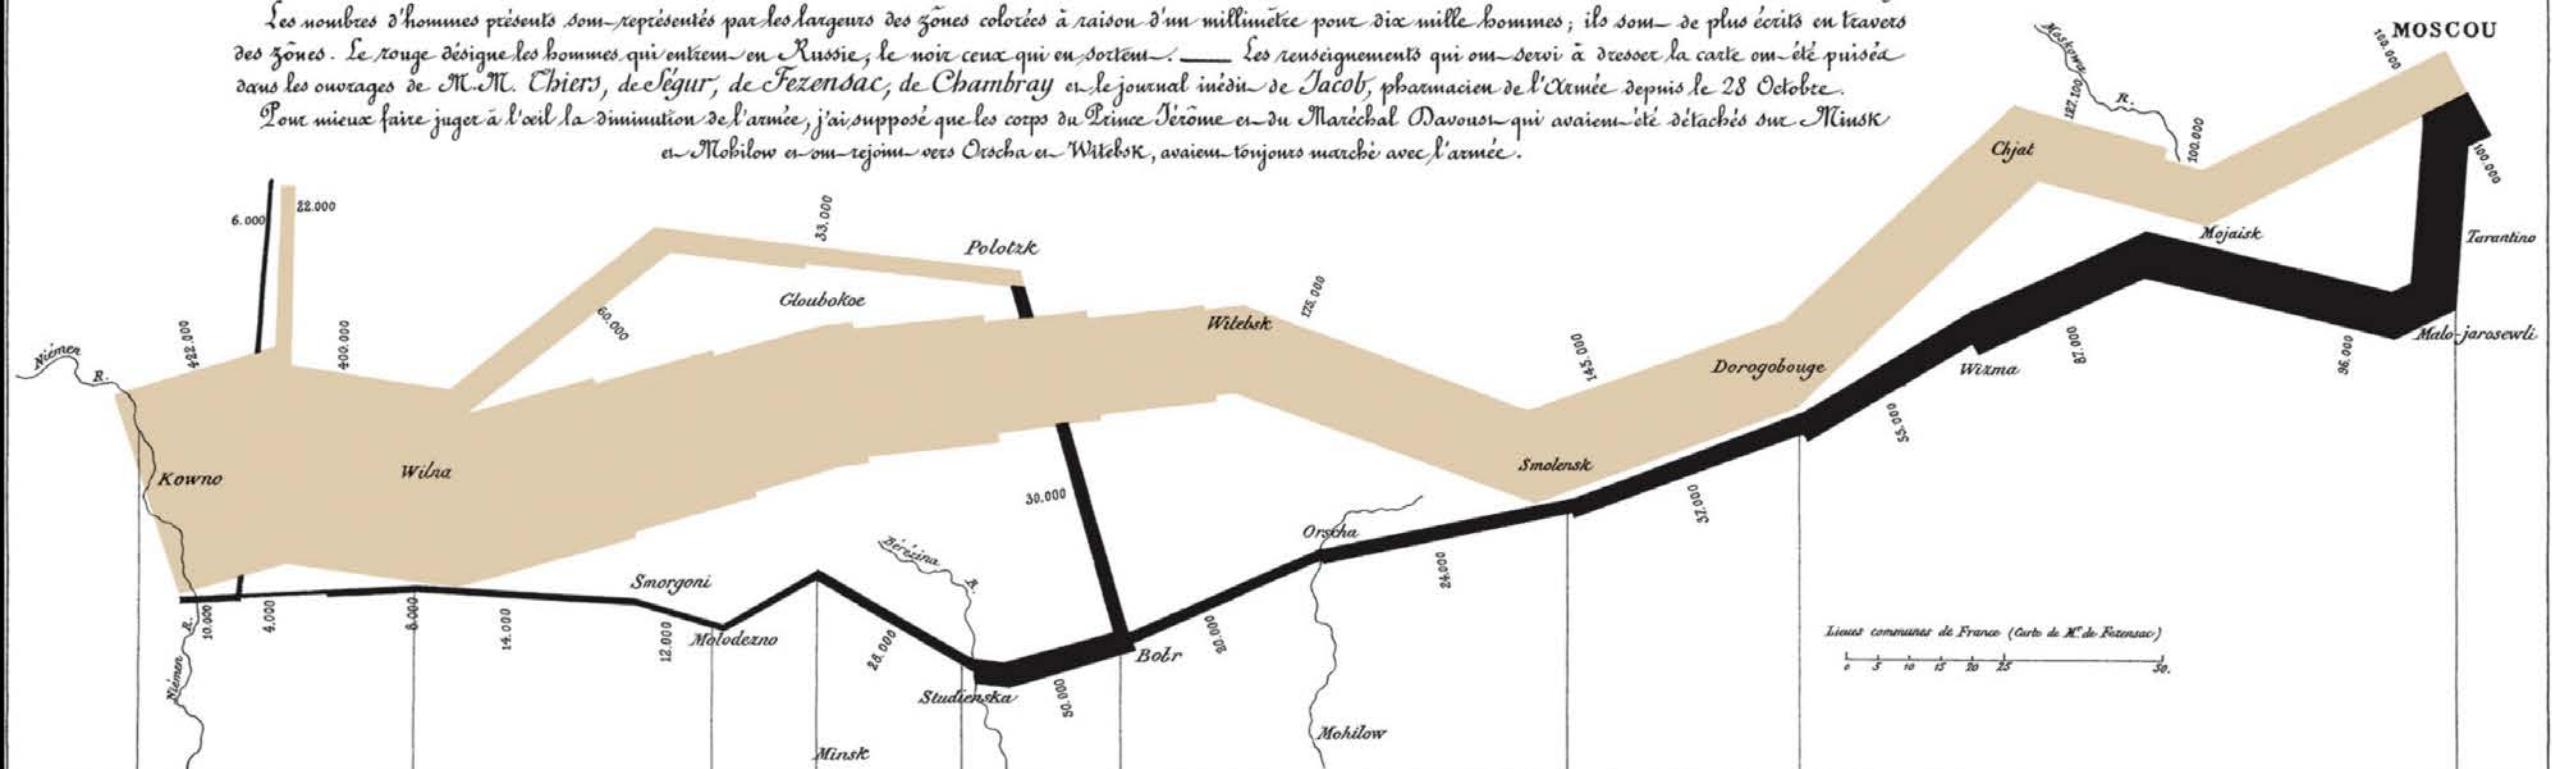

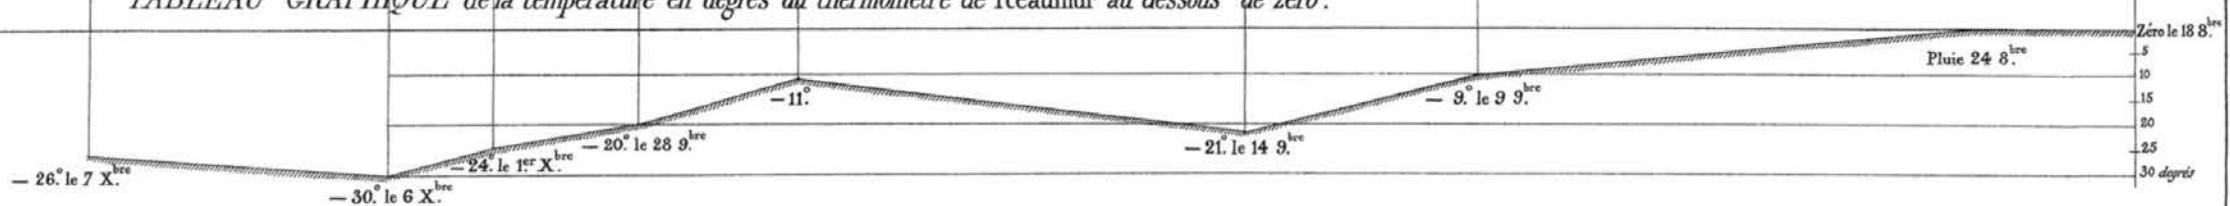

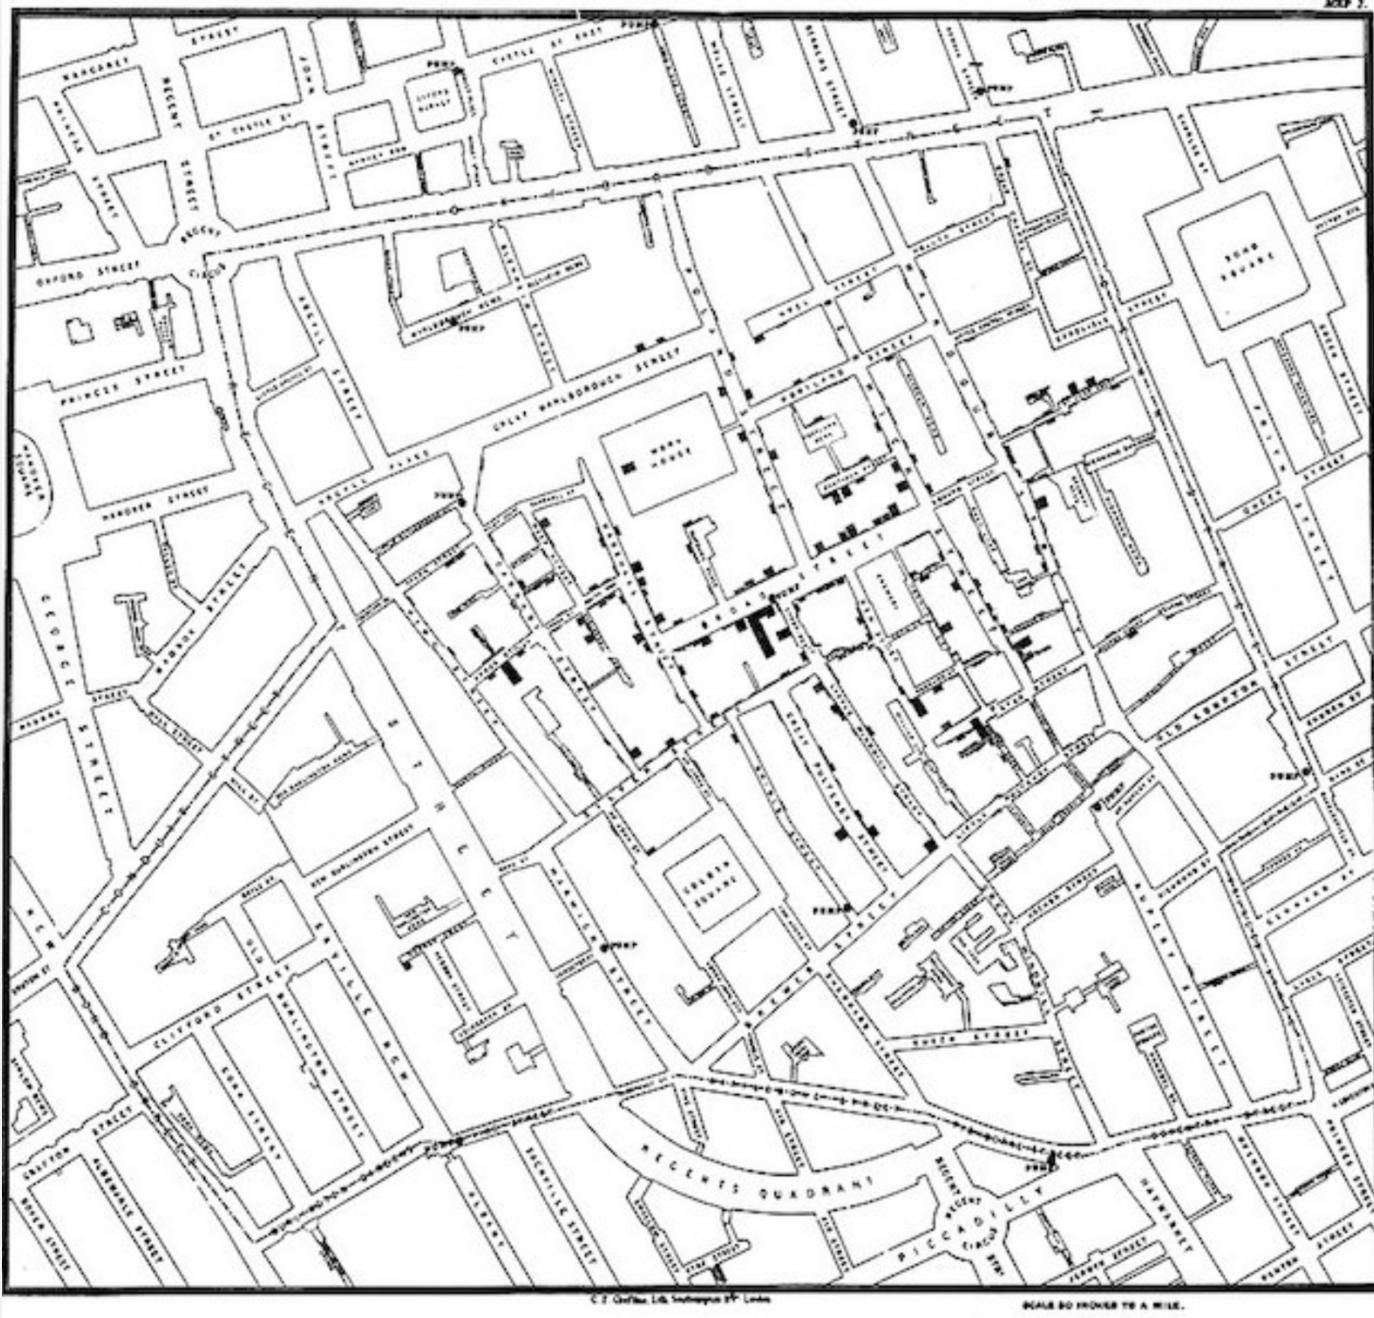

TABLEAU GRAPHIQUE de la température en degrés du thermomètre de Réaumur au dessous de zéro.

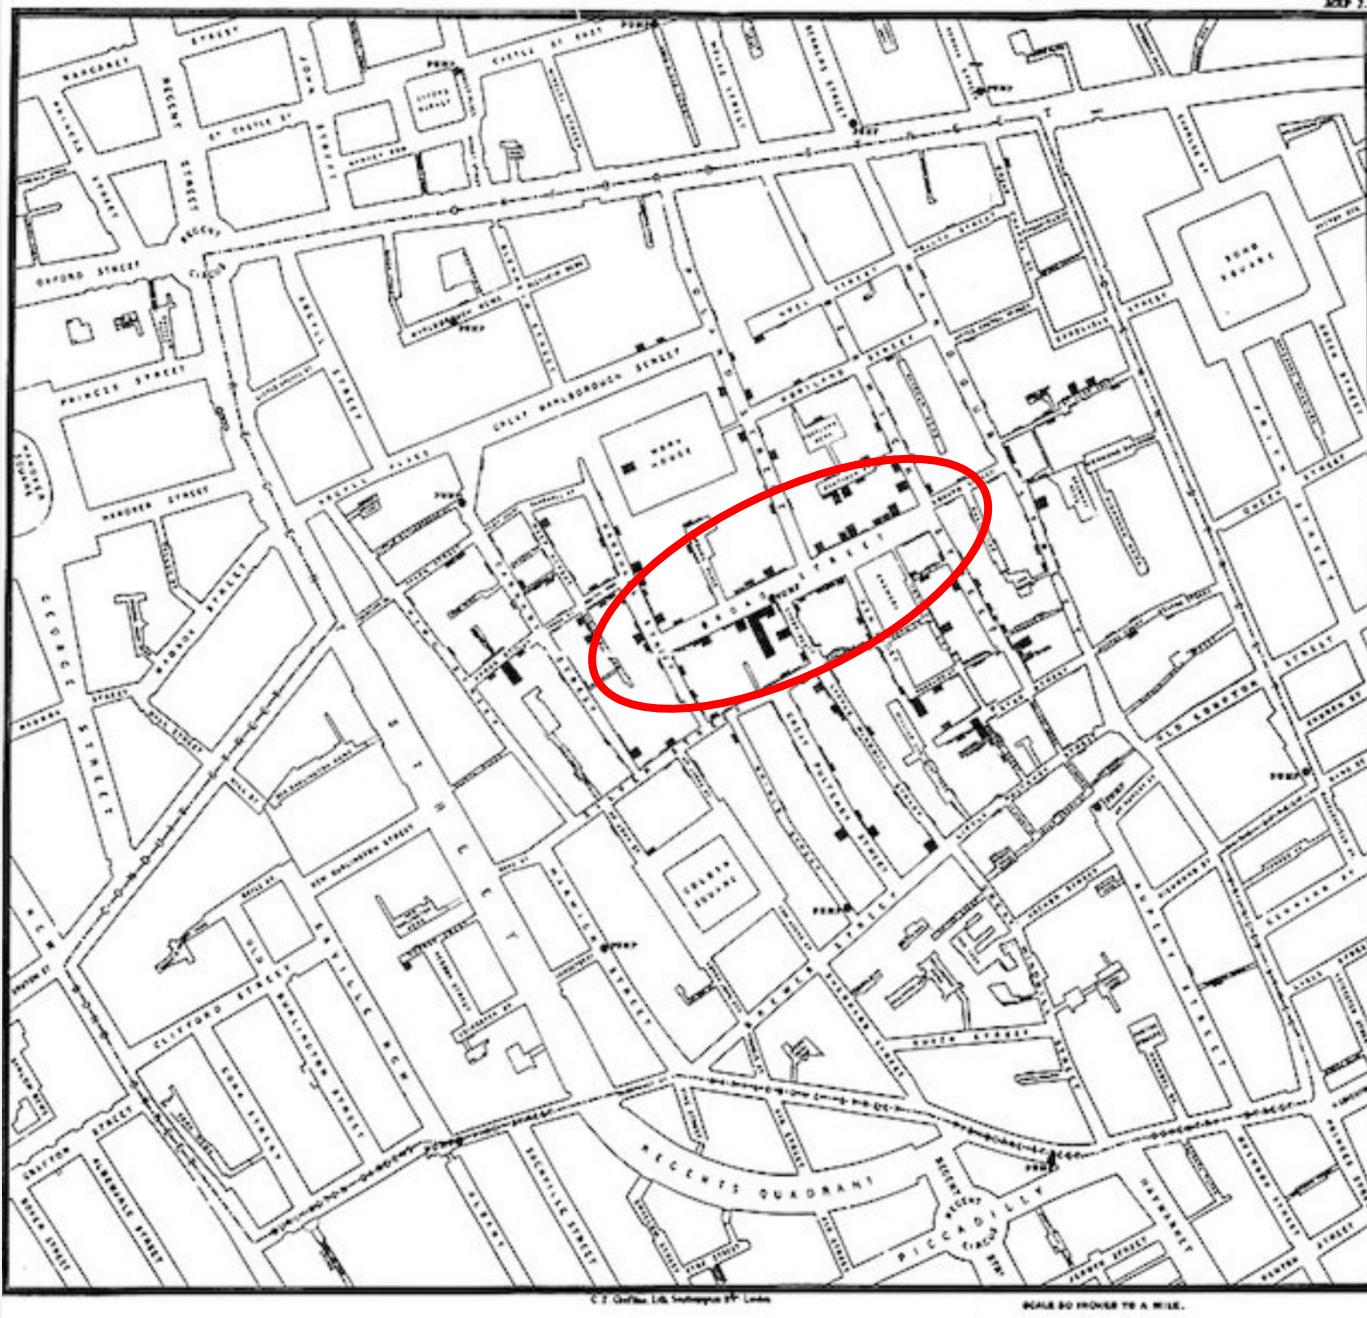

Les Cosaques passent au galop
le Niemen gelé.

John Snow and the cholera in London (1854)

John Snow and the cholera in London (1854)

The enemy was a public water pump in Broad Street.

1856. Rose diagram of Florence Nightingale

famous for her contributions to medicine, her rose diagram describes causes of deaths in soldiers during the Napoleonic wars and enabled improving sanitation for soldiers on the battlefield

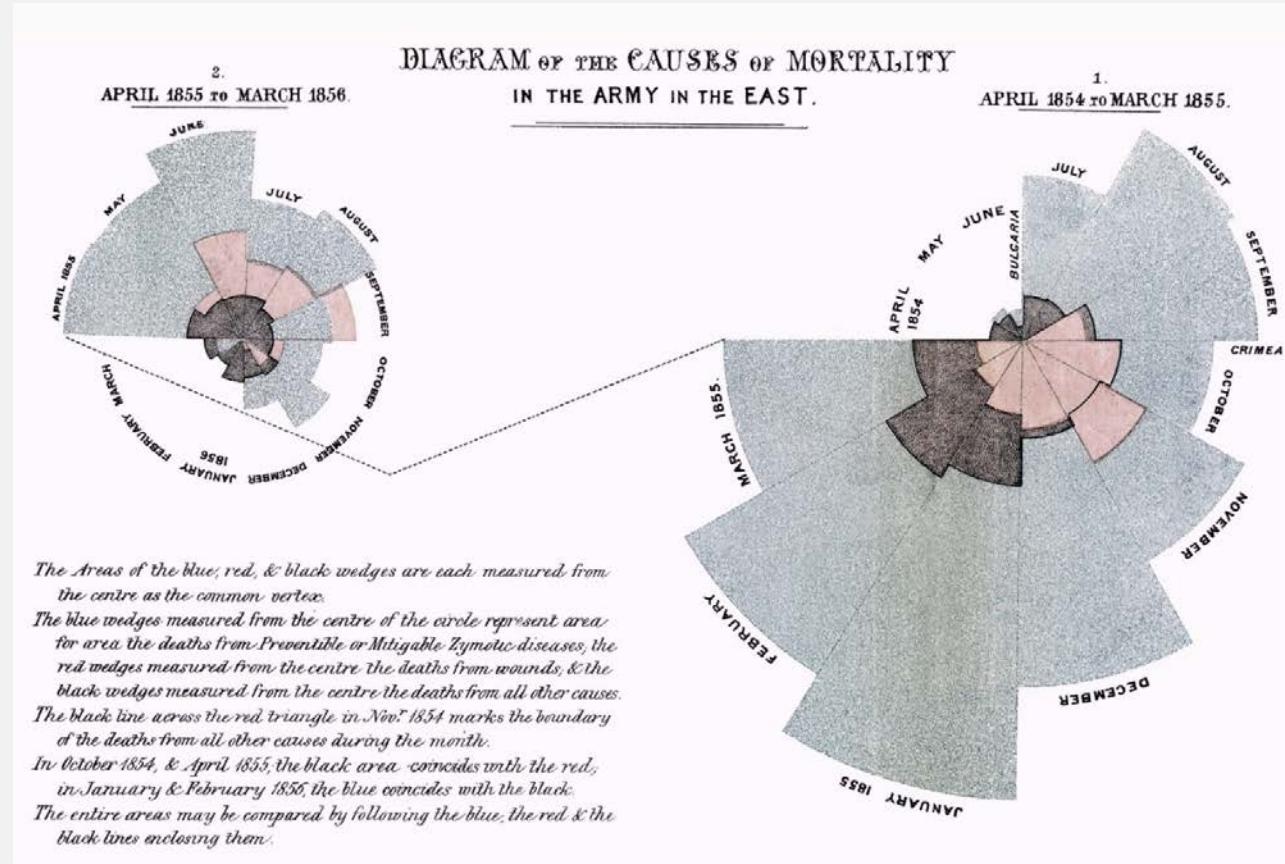

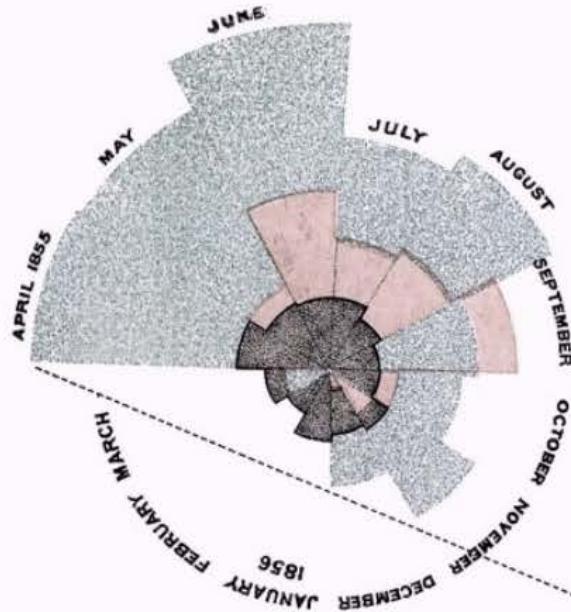

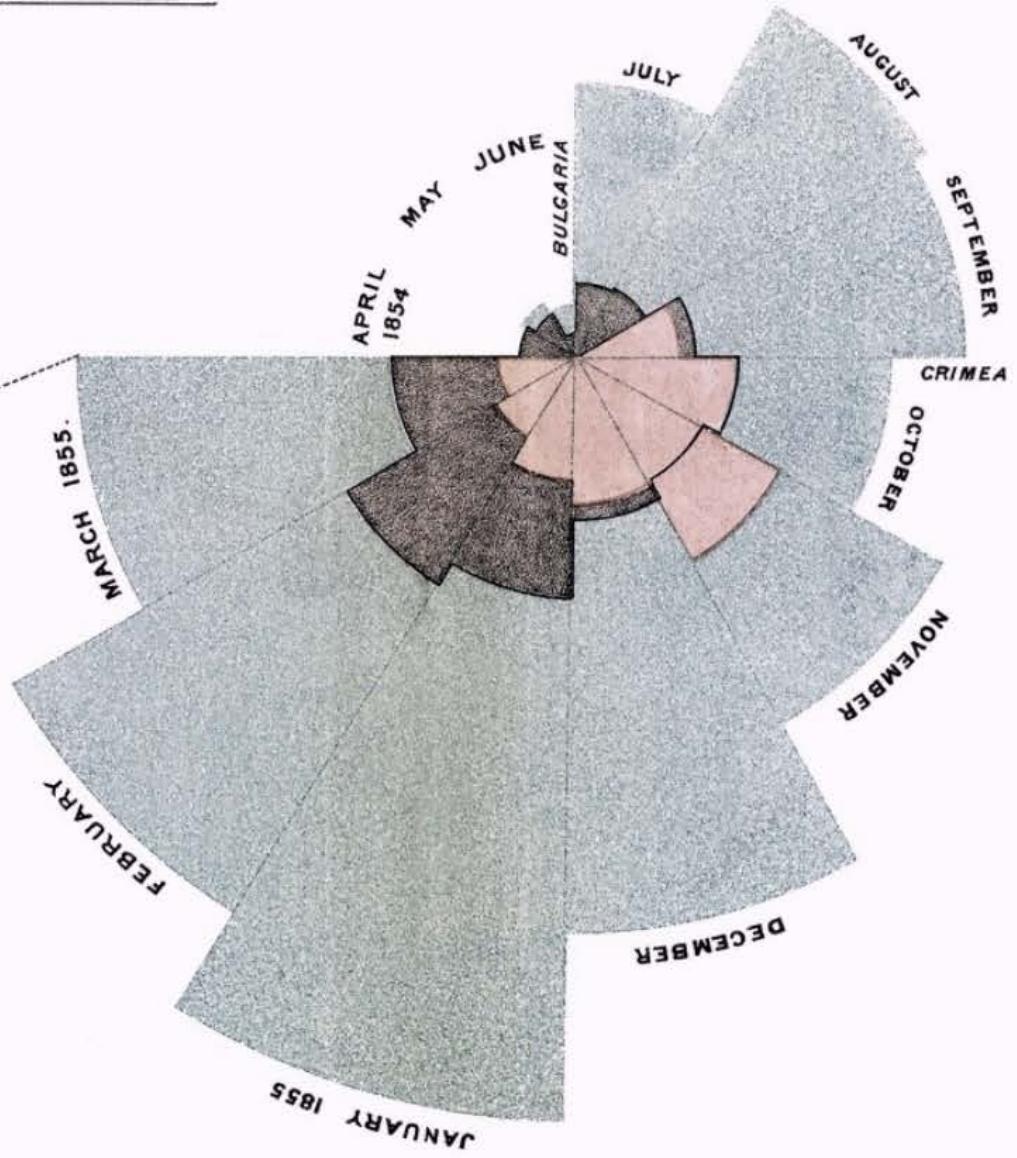

DIAGRAM OF THE CAUSES OF MORTALITY
IN THE ARMY IN THE EAST.

2.
APRIL 1855 TO MARCH 1856.

1.
APRIL 1854 TO MARCH 1855.

The Areas of the blue, red, & black wedges are each measured from the centre as the common vertex.

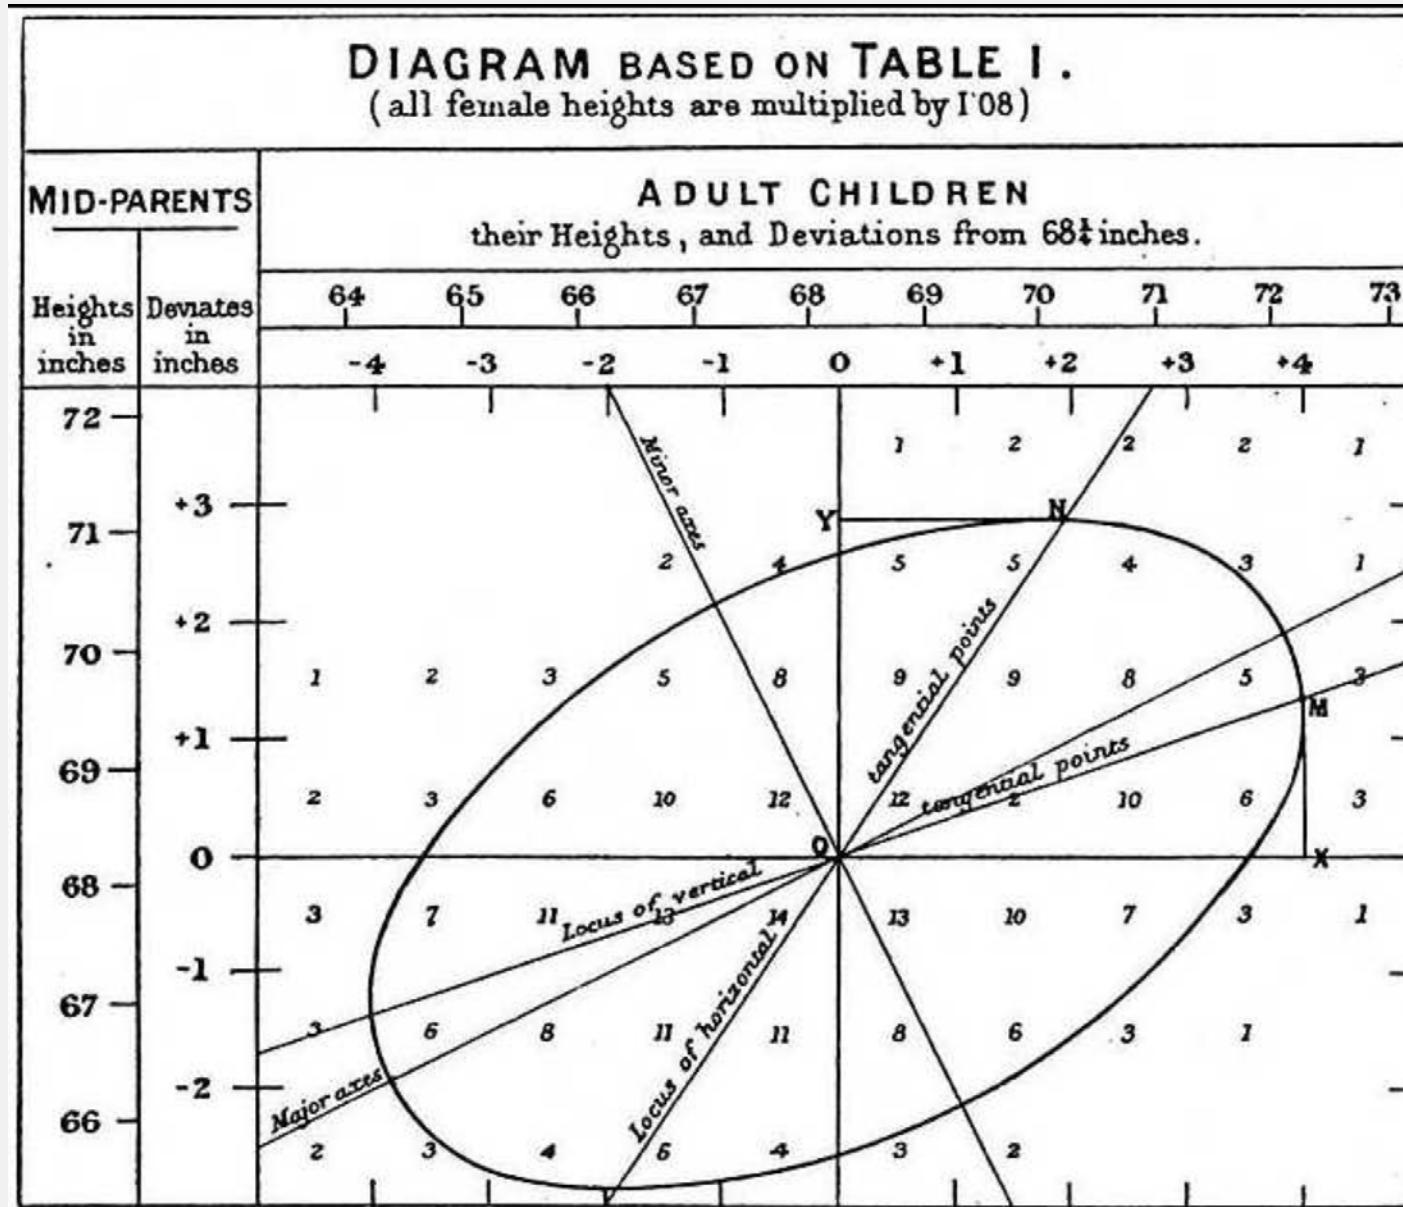

The blue wedges measured from the centre of the circle represent area for area the deaths from Preventible or Mitigable Zymotic diseases; the red wedges measured from the centre the deaths from wounds, & the black wedges measured from the centre the deaths from all other causes.

The black line across the red triangle in Nov^r 1854 marks the boundary of the deaths from all other causes during the month.

In October 1854, & April 1855, the black area coincides with the red; in January & February 1856, the blue coincides with the black.

The entire areas may be compared by following the blue, the red & the black lines enclosing them.

1886. Galton's correlation diagram (parents' height and Adult children's height)

And from the beginning of the past century (1900) many graphs/plots/charts have been created

And we arrive to modern times:

A visual history of human knowledge (Manuel Lima)

[TED'S TALKS](#)

About graphs

Graphs visualization generally represents interactions between entities, as a network:

A Survey on Graph Visualization

Visual Analysis of Large Graphs: State-of-the-Art and Future Research Challenges

A Survey on Information Visualization for Network and Service Management

UNIPred-Web: a web tool for the integration and visualization of biomolecular networks for protein function prediction

CerebroVis: Designing an Abstract yet Spatially Contextualized Cerebral Artery Network Visualization

Treemaps by BenShneiderman for visualizing graphs and multiresolution data:

Graphs visualization captures connections between elements, shows relationships

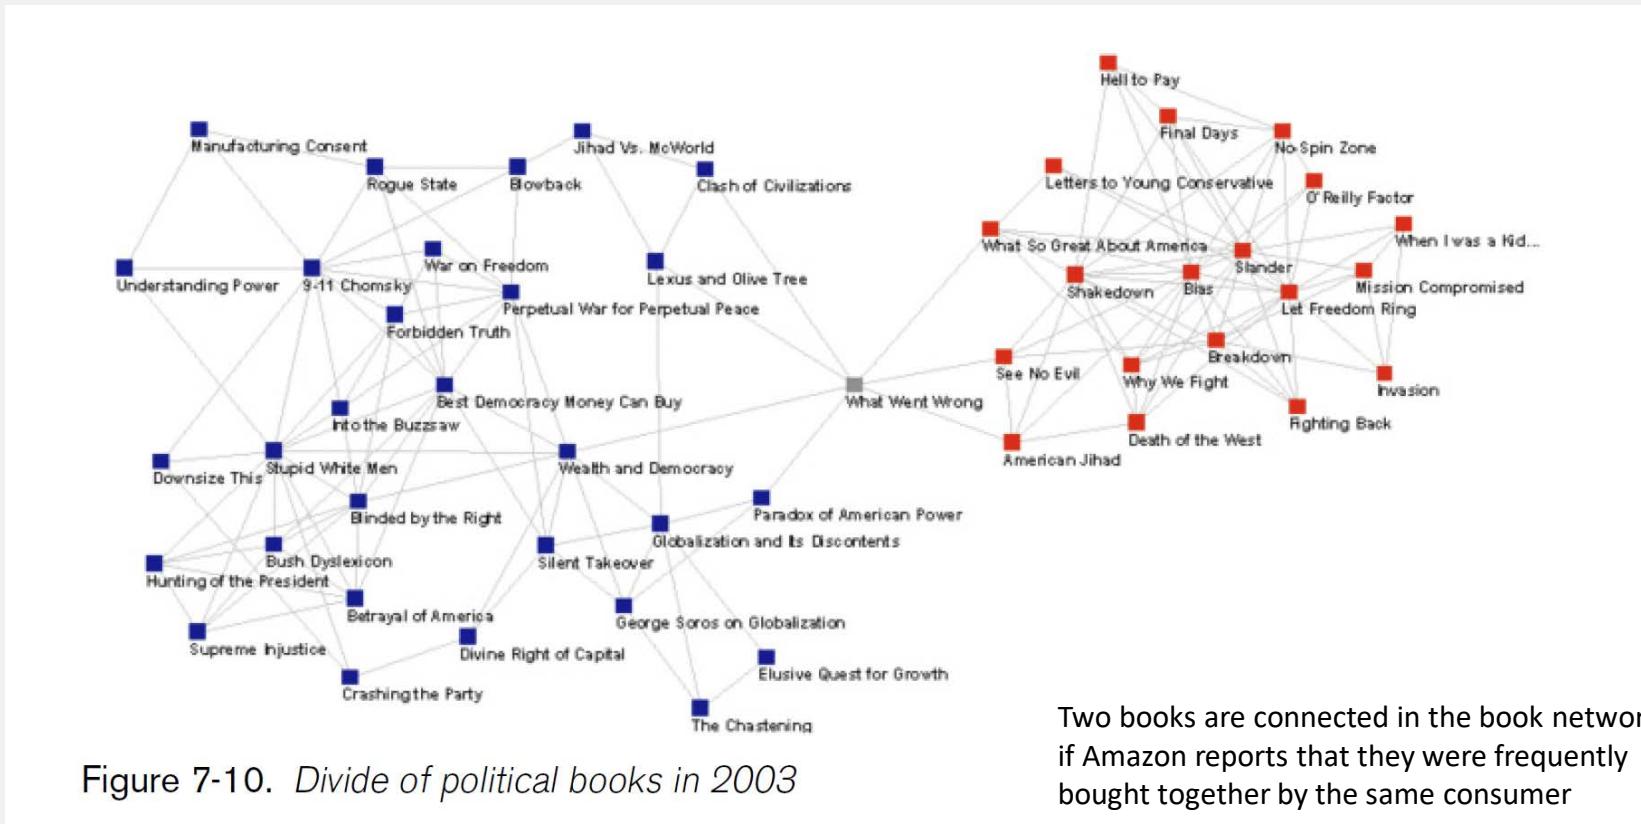

Figure 7-10. Divide of political books in 2003

I have been doing a social network analysis of the purchase patterns of political books since 2003. Unsurprisingly, from my very first mapping I saw two distinct political clusters: a red one designating those who read right-leaning books and a blue one designating those who read left-leaning books. In my 2003 network analysis, I saw just one book holding the red and blue clusters together. Ironically, that book was named *What Went Wrong*. This map is shown in Figure 7-10.

Network visualizations allow understanding social phenomena

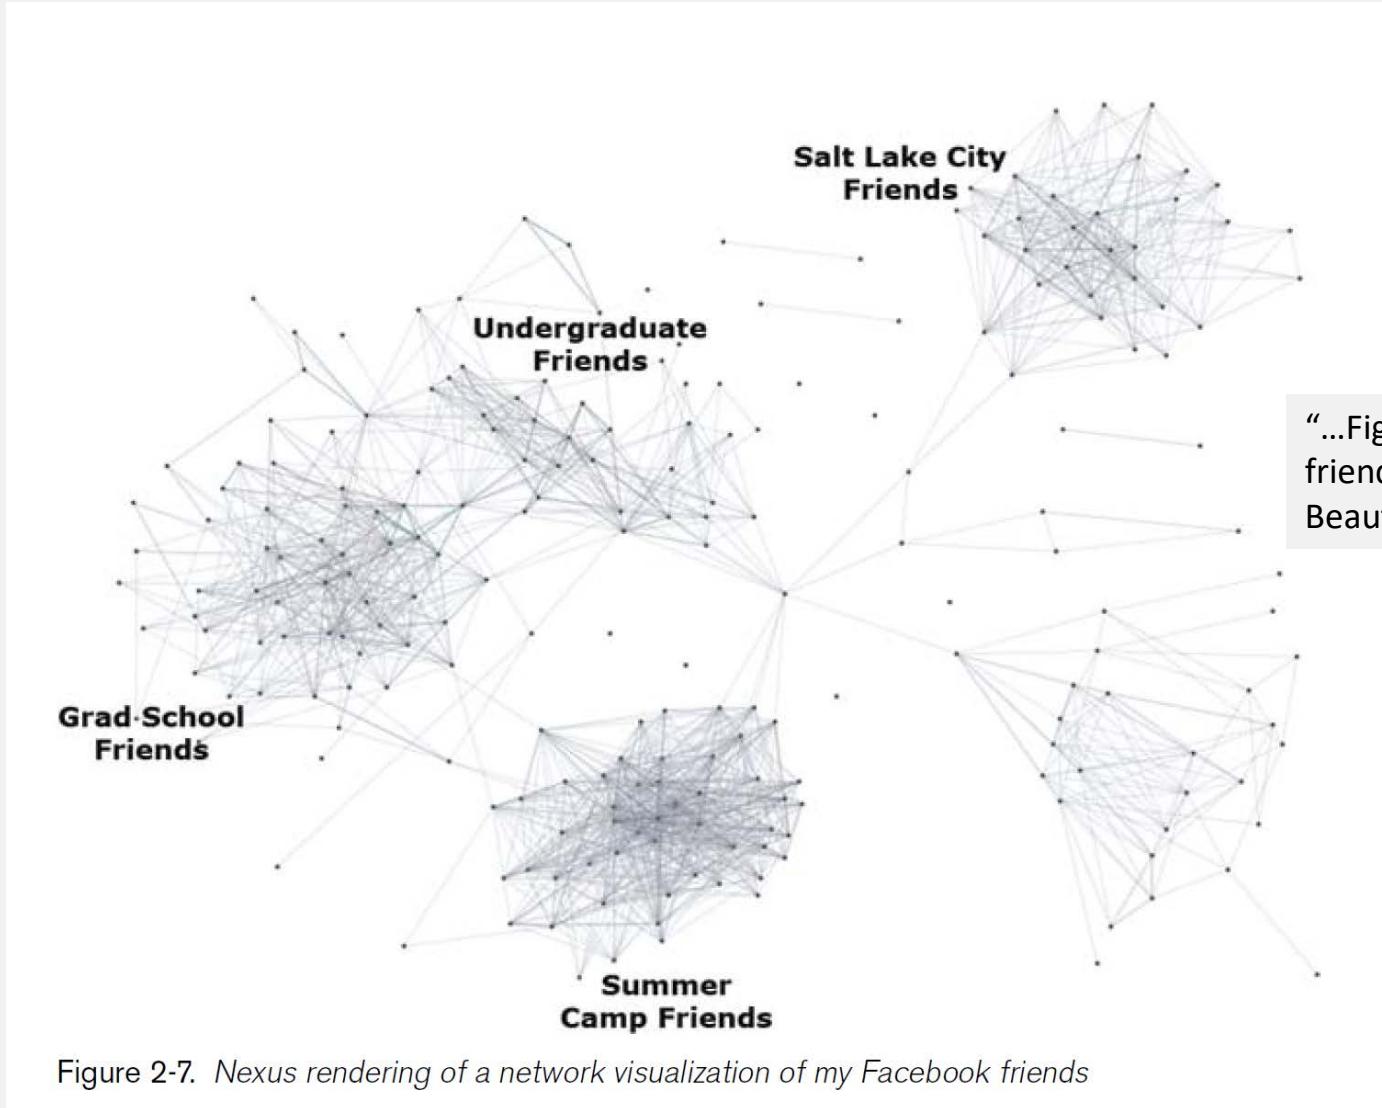

Figure 2-7. Nexus rendering of a network visualization of my Facebook friends

“...Figure 2-7 shows a network visualization of my Facebook friends and how many of them have “friended” one another.”
Beautiful Visualizations

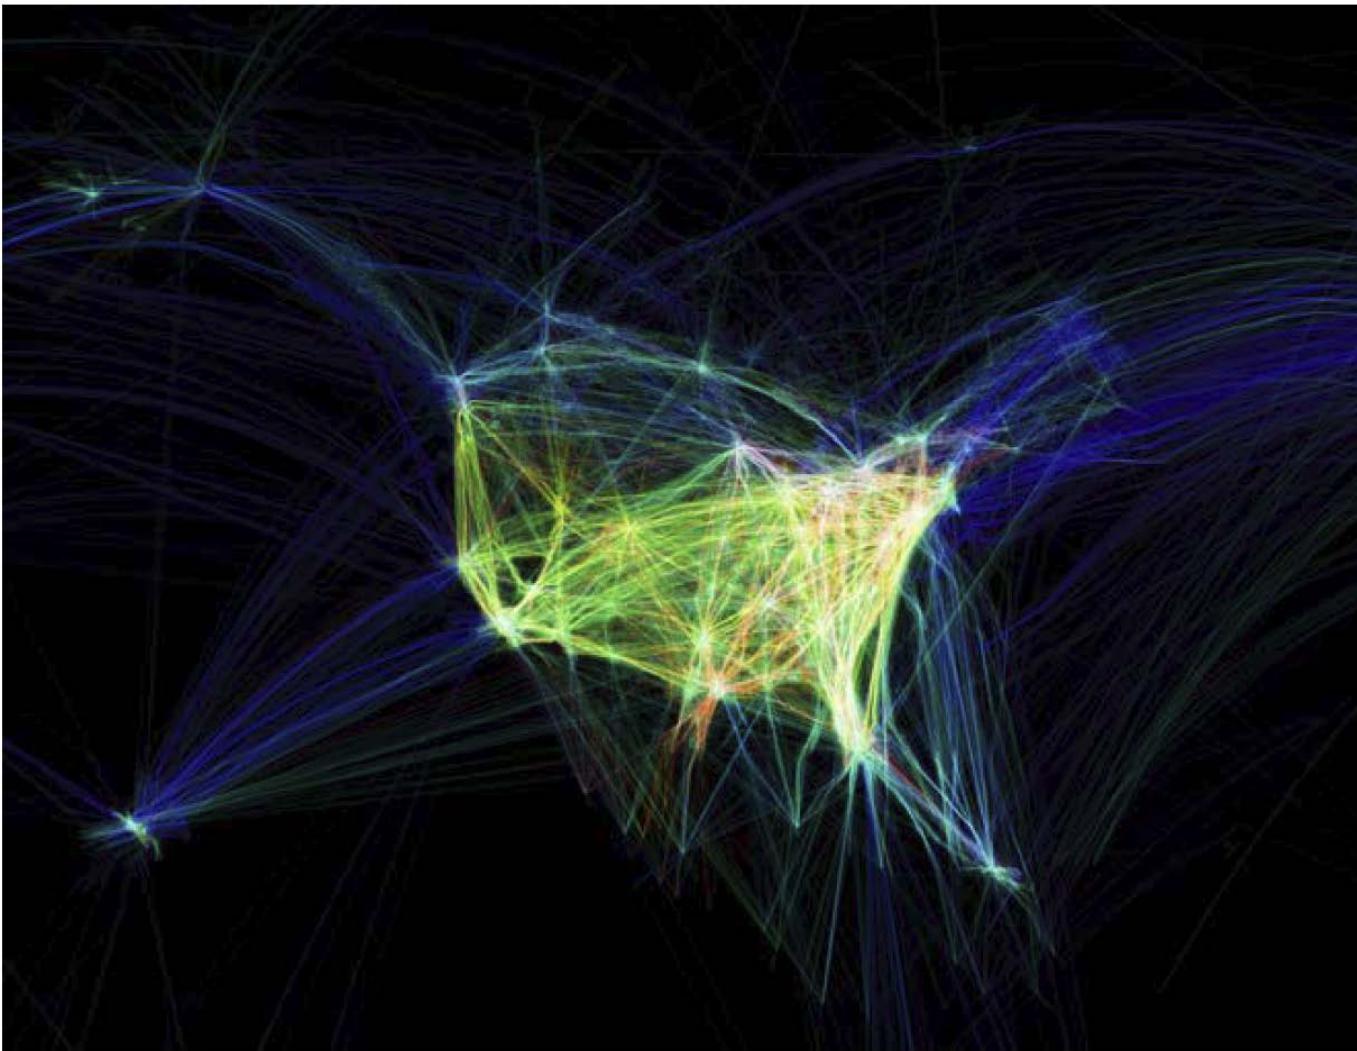

Figure 6-1. *Flight Patterns*, a visualization of aircraft location data for airplanes arriving at and departing from U.S. and Canadian airports

[...] *Flight Patterns* is a project I started in 2005 that visualizes civilian air traffic in the United States and Canada. It [...] traces aircraft arriving and departing from U.S. and Canadian airports over a 24-hour period. [...]"

Beautiful visualizations

<http://www.aaronkoblin.com/work/flightpatterns/>

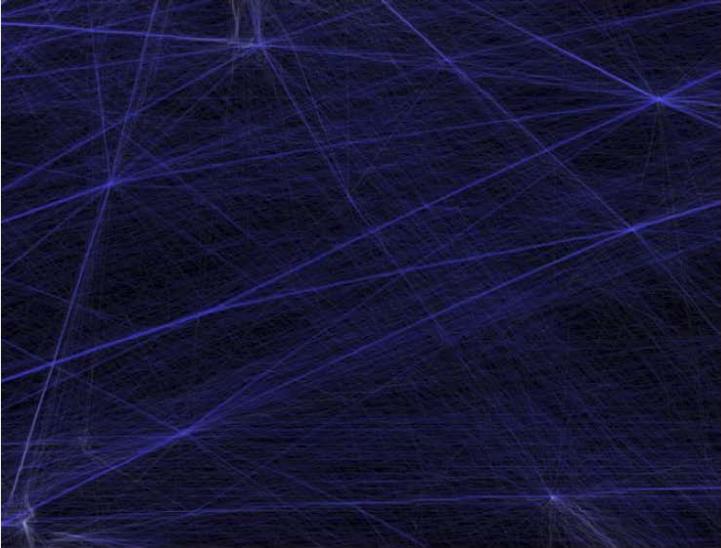

Figure 6-2. Closeup of a section of Figure 6-1 that reflects what I expected to find throughout the data: flight paths going in every direction

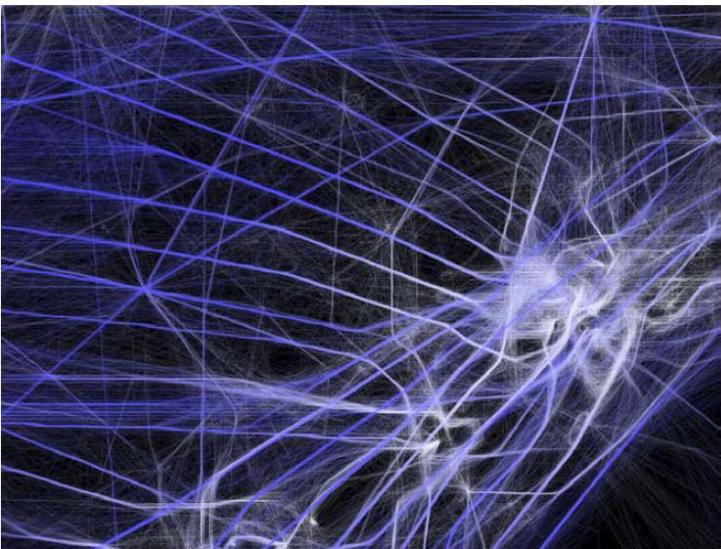

Figure 6-3. Another closeup that reflects what I found to be common instead: clear, bright lines that indicate flight paths followed closely by high volumes of planes

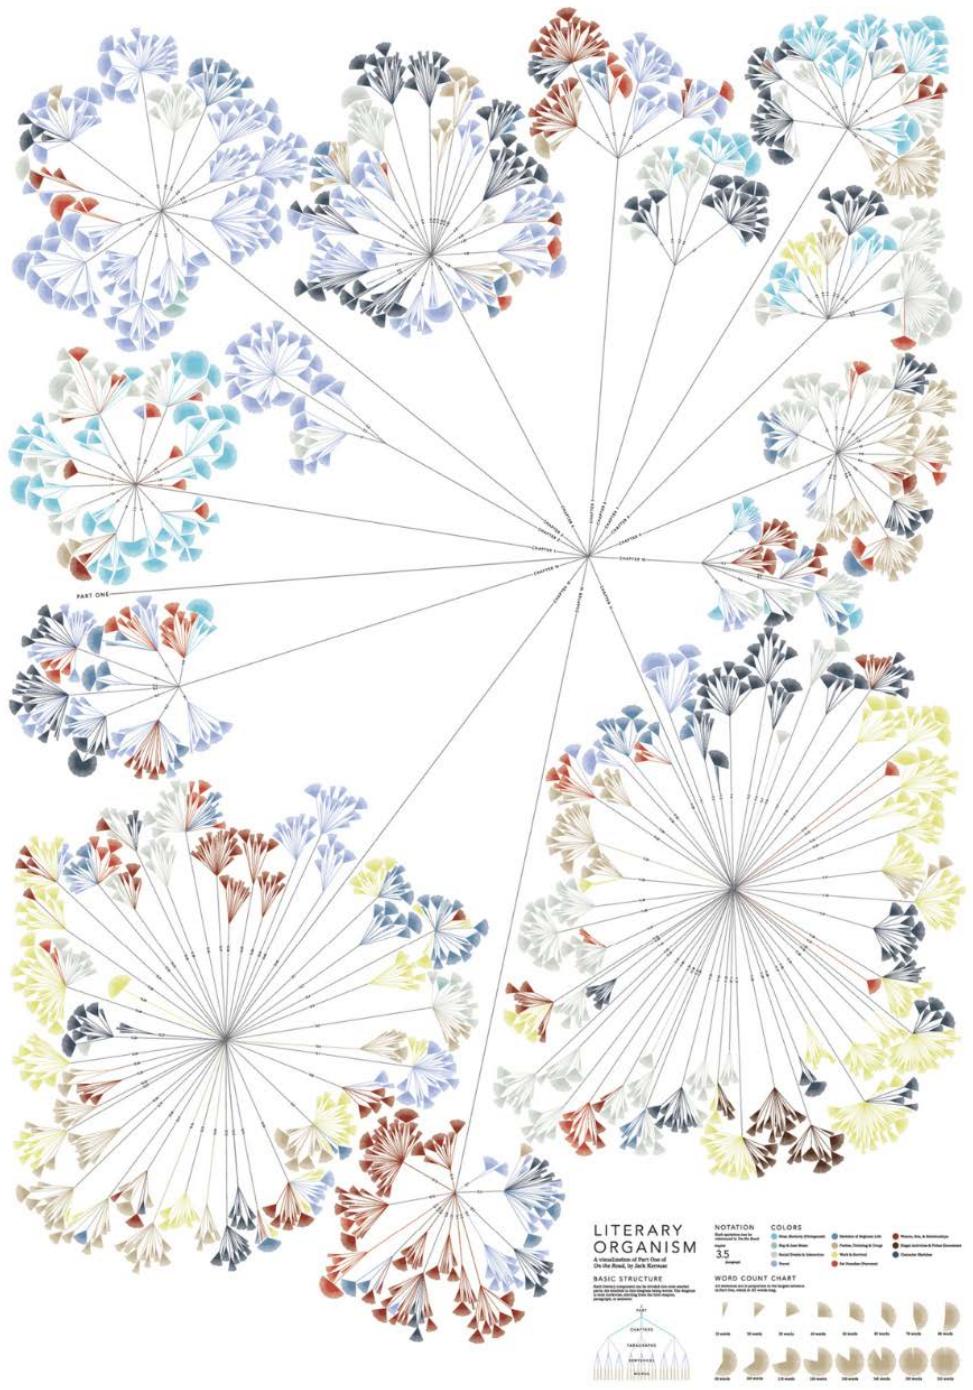

- Vision of flight patterns (concentration of aerial paths).
- Perception of the wide number of flights passing over our heads.

Uses colors for showing quantities.

Using colors for describing quantities is fine if user do not need an exact perception of quantities
(color perception is not international, areas are international)

Visualizations have been realized by implementing with [Processing](#)

What do we use to plot them and see them?

Suppose that for each of the 50 states of the U.S.A. we need to study cancer rates.

Here are the data ([csv](#), [xlsx](#)) for years 2005, 2014-2018

WHAT ABOUT A LOOK-UP TABLE??

SILLY TABLE DESIGN BRINGS NO UNDERSTANDING
OR SILLY UNDERSTANDING

Tables are generally used for looking up specific numbers,

BUT:

They should be well organized

They should be placed in the right place

They should be well designed

The should contain the right data

Why not using colorbars??

Esempio

Let's using colorbars in the csv

Anyhow,

How could we create good tables?

When could we use them?

The Gestalt principles and data/ink ratio will help us!

Otherwise, we could use maps, e.g. interactive maps:

https://www.cdc.gov/nchs/pressroom/sosmap/cancer_mortality/cancer.htm

Here is a (per country) solution: same periods but different types of cancers

Maps of age adjusted cancer rates for the 3056 countries in the USA. The size and shape of each country might be described by at least four values...

THIS MAP VISUALIZES:

$3056^*(1 + 4)$ values

In highest decile,
statistically significant

Significantly high, but
not in highest decile

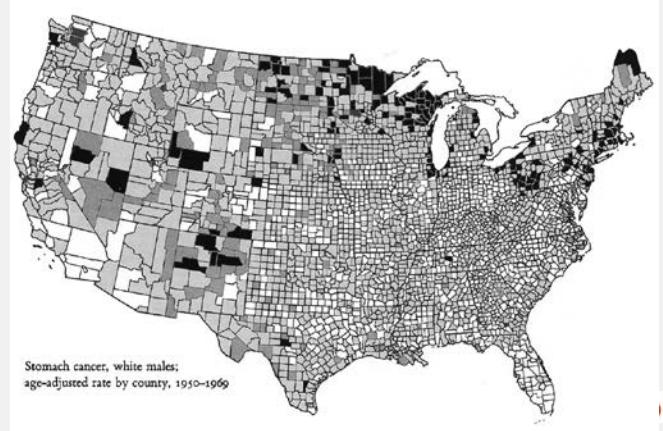

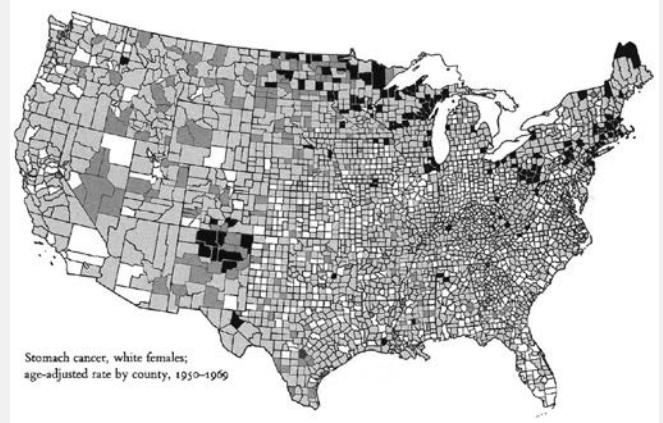

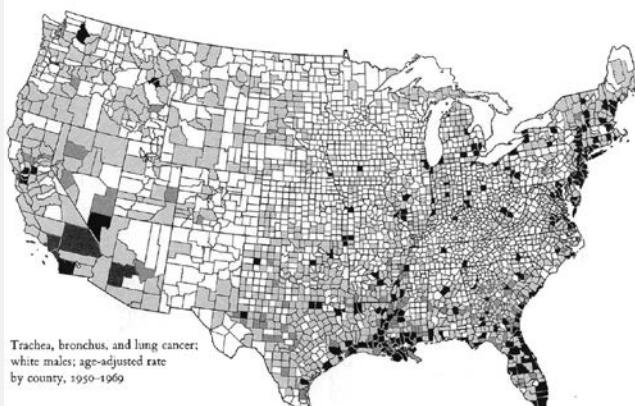

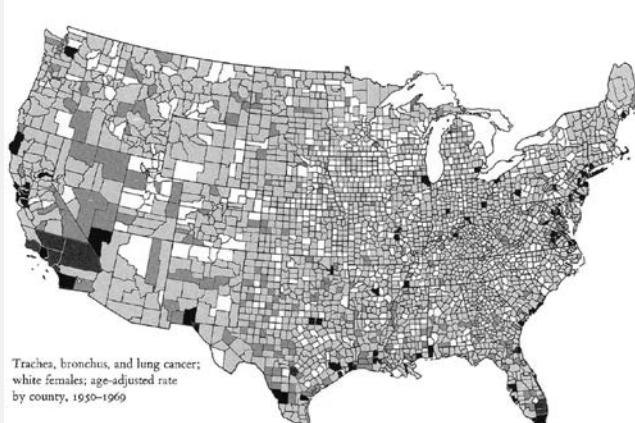

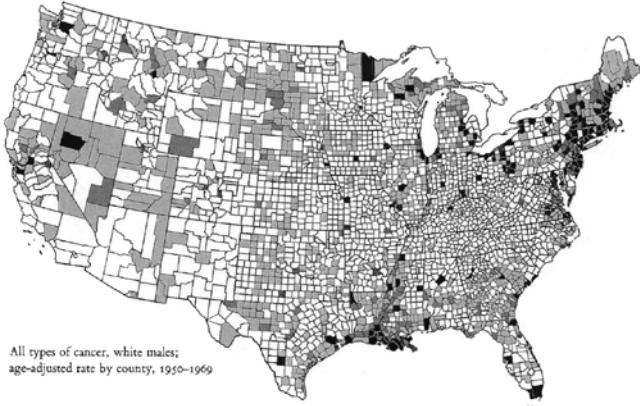

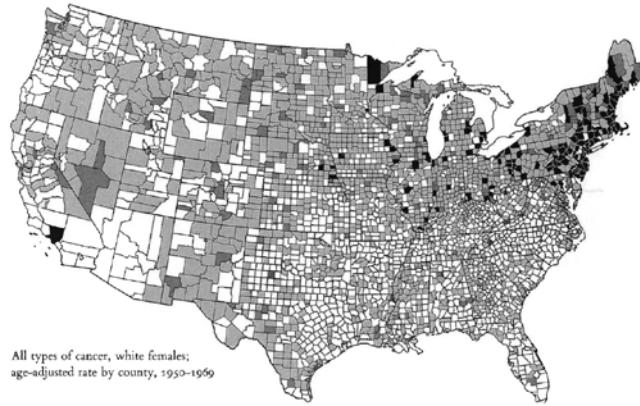

In highest decile, but not
statistically significant

Not significantly different
from U.S. as a whole

Significantly lower than
U.S. as a whole

What we «see» when looking at the picture:

- High low rates
- Hot spots
- Women / men difference in rates
- Type of tumour

Looking at data we may capture risk zones and men/women risks

E.g. we could start planning ad hoc screens in different areas or try to understand if there are particular reasons for cancers being concentrated in certain areas.

We could use maps

RECALL THAT SILLY DATA BRING TO SILLY VISUALIZATIONS!

Data must be well done

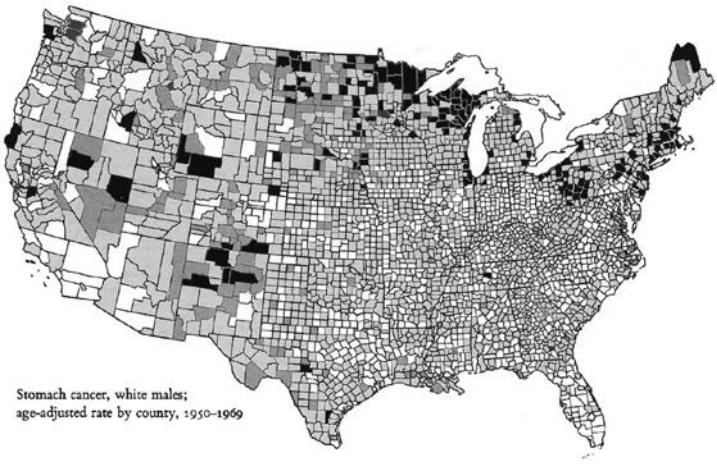

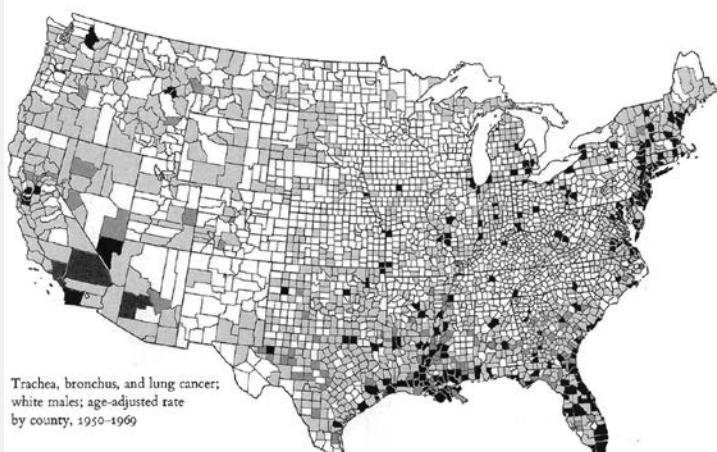

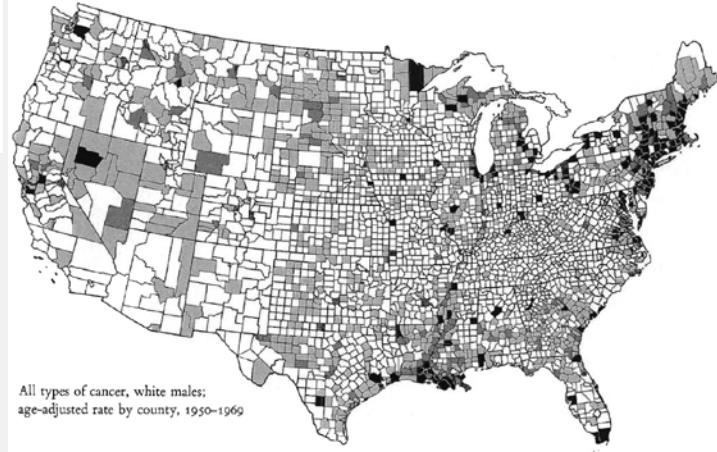

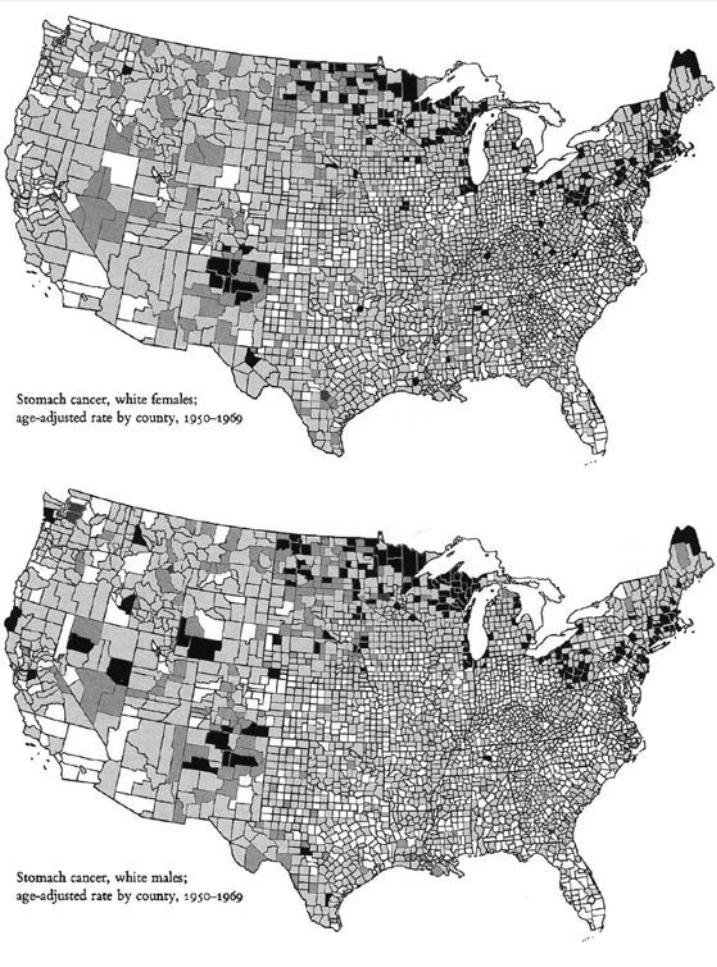

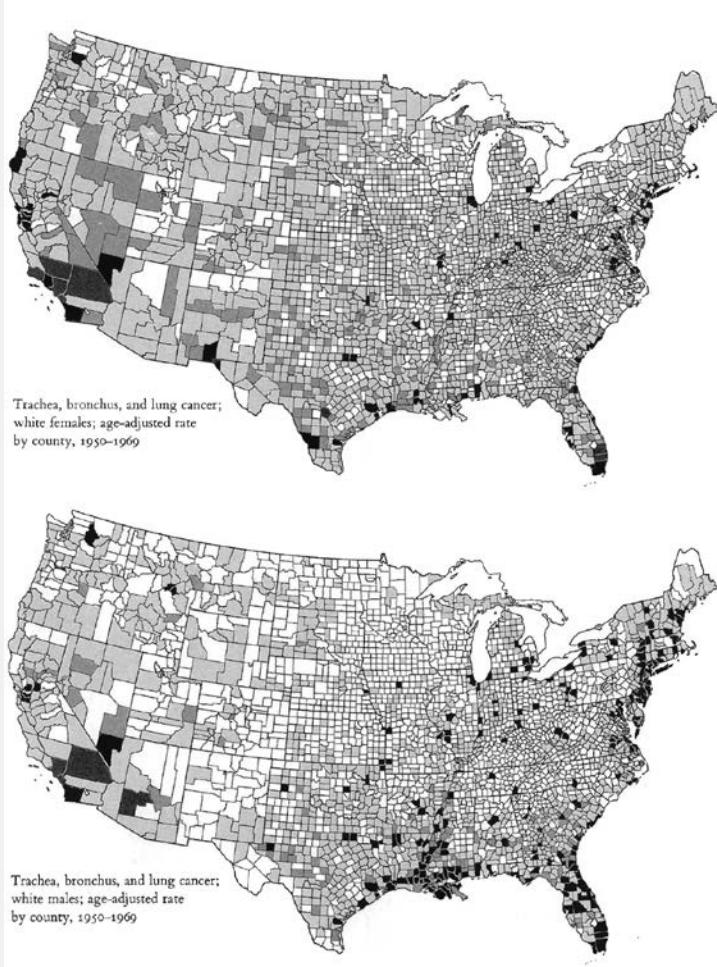

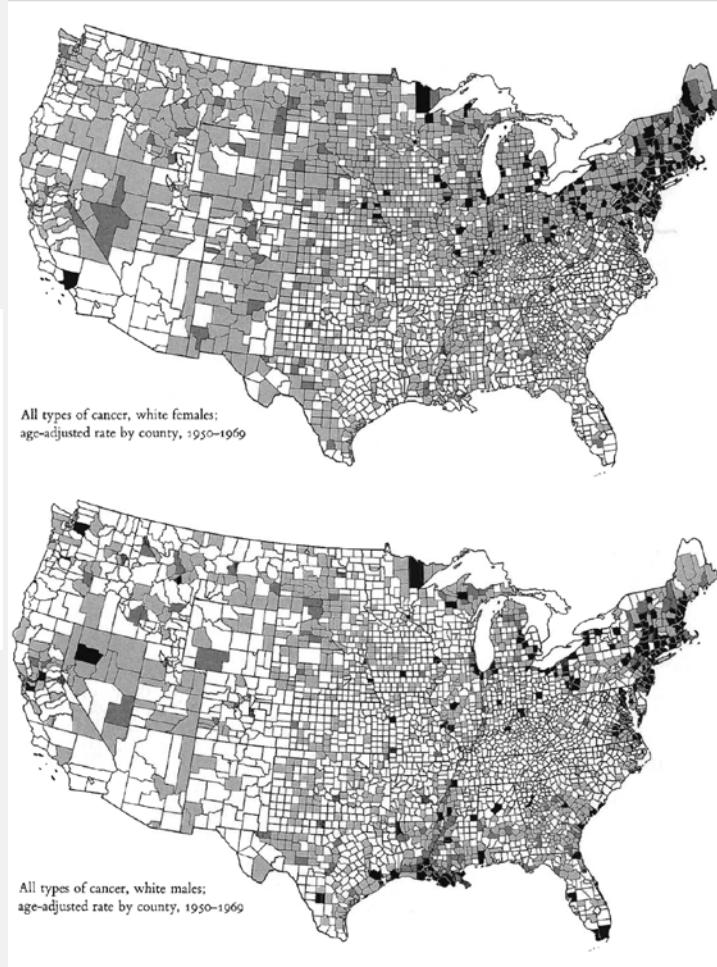

- Data should not be biased (Plotted data are diagnosis data. What if there are errors in diagnosis?)
- Moreover, cancer rate must be age-adjusted, sex-adjusted,....

Maps of age adjusted cancer rates for the 3056 counties in the USA.

- In highest decile,
statistically significant
- Significantly high, but
not in highest decile
- In highest decile, but not
statistically significant
- Not significantly different
from U.S. as a whole
- Significantly lower than
U.S. as a whole

x-ADJUSTED ... what does it mean?

Example with AGE-ADJUSTED

Study the rate of an event in the population of geographic area G

INPUT:

H : age ranges

$$H = \{h_1, h_2, h_3, \dots, h_{20}\} = \{1-4, 5-9, 10-14, \dots, 75-79, 80-84, \dots, 95-99\}$$

Age Standardization of Death Rates:
Implementation of the Year 2000 Standard

If N is the number of age ranges

Estimate the number of event for each age range

$$E = [e(h_1), \dots, e(h_N)]$$

$e(h_i)$ = # of events in persons living in geographic area G with age h_i

Estimate the number of persons in G for each age.

$$N = [n(h_1), \dots, n(h_N)]$$

$n(h_i)$ = # of persons in G with age h_i

-----PROCEDURE-----

- 1) FOR EACH AGE RANGE compute the **age-specific rate (ASR)** per h

ASR(h) answers to the question: if all the persons with age in range h in G were 100,000 which rate would I have measured?

The rate in the area of study (e.g., county, state) for age group h is computed by:
dividing the number of events in people with age h by the number of people with age in h (in geographical area G)
and then multiplying by a constant of 100,000.

This results in an age-specific event rate (ASR) per 100,000 population for the age group h :

$$\text{ASR}(h) = \frac{\text{events in age group}}{\text{estimated population of that age group}} \times 100,000 = \frac{e(h)}{n(h)} \times 100,000$$

Each ASR is normalized by multiplying it by the proportion of the standard population of that same age group (see Tables)

$$ASR_{Norm}(h) = ASR(h) \times \text{standard proportion}(h)$$

The age-specific results are summed to get the age-adjusted death rate for the area of study.

$$\begin{aligned} AAR &= \sum_{\text{for each age group } h} ASR(h) \times \text{standard proportion}(h) \\ &= \sum_{h \in H} ASR_{Norm}(h) \end{aligned}$$

This is called the direct method of standardization.

Age Group (years)	Standard Population
0,0	1 000
1-4	4 000
5-9	5 500
10-14	5 500
15-19	5 500
20-24	6 000
25-29	6 000
30-34	6 500
35-39	7 000
40-44	7 000
45-49	7 000
50-54	7 000
55-59	6 500
60-64	6 000
65-69	5 500
70-74	5 000
75-79	4 000
80-84	2 500
85-89	1 500
90-94	800
95+	200
Total	100 000

Vision trumps all other senses. We learn and remember best through pictures, not through written or spoken words.

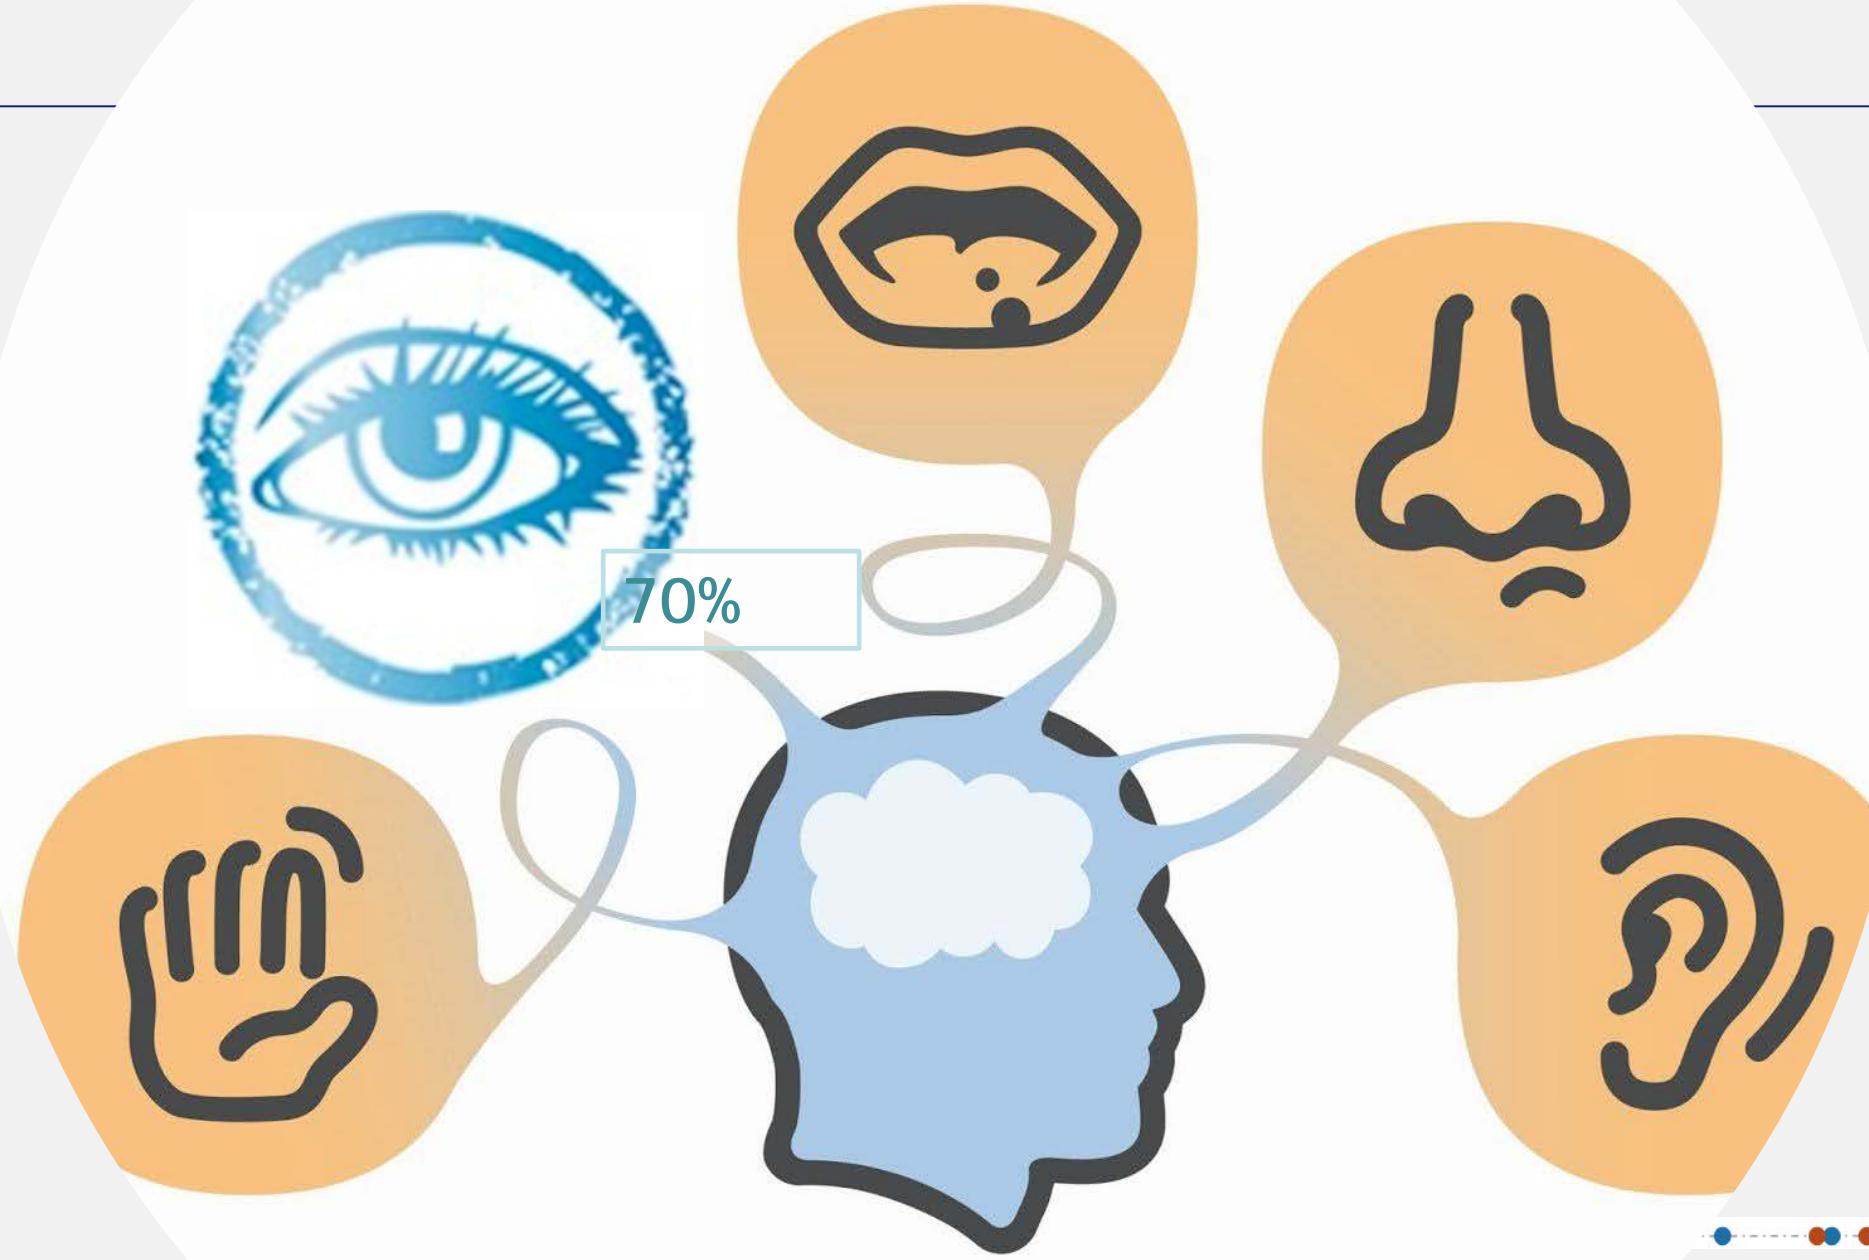

—JOHN MEDINA, *BRAIN RULES*

70%

70% of sensory receptor are for viewing

Therefore vision captures the **70%** of the stimuli humans receive from the external world

Stephen Few, «Show me the Numbers», pag 61
<http://www.percezionevisiva.com/anatomia-occhio/>

Most of our cognition then happens thanks to vision!

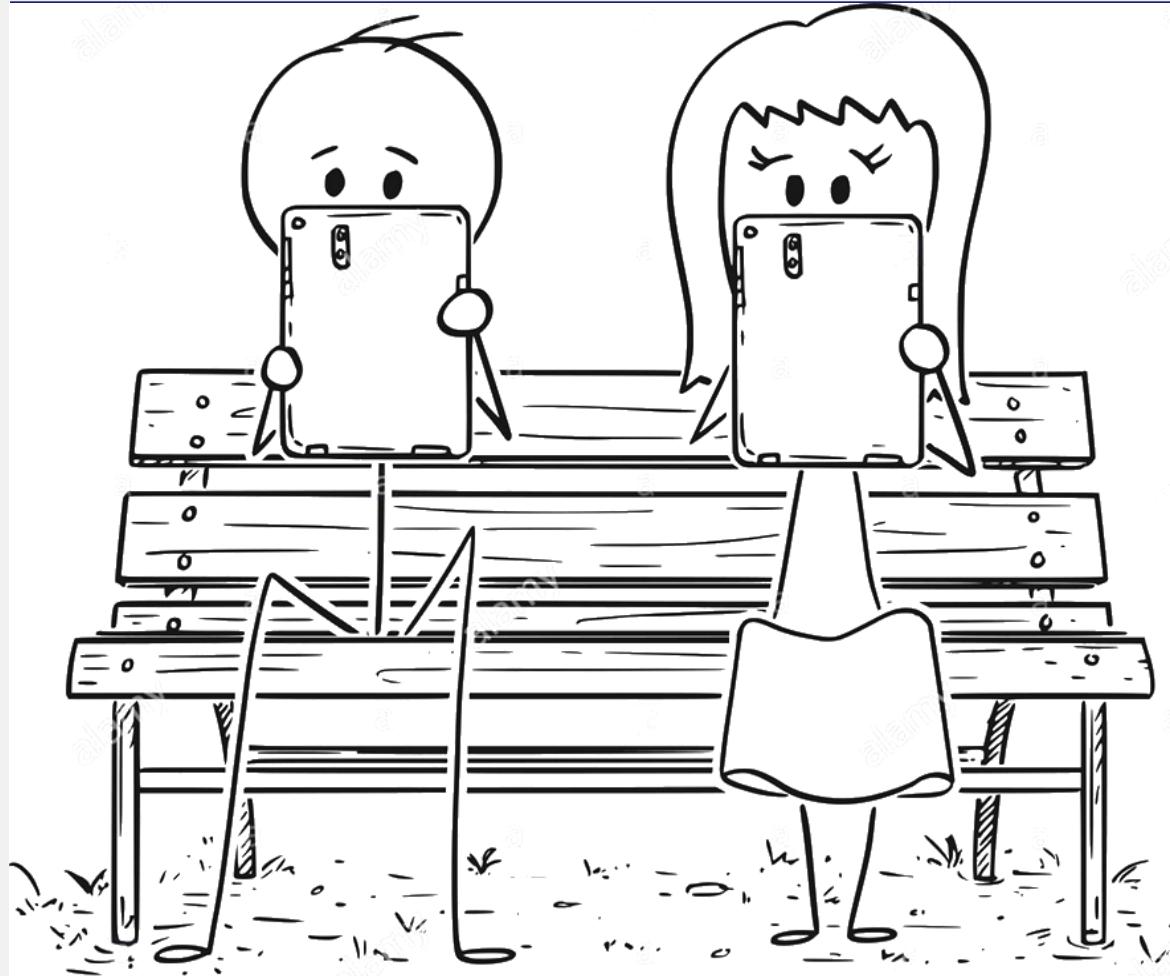

Sensation-Perception-Cognition

«La caratteristica distintiva dei cervelli come il nostro è la prodigiosa capacità di creare mappe»

Antonio Damasio, *Self Comes to Mind: Constructing the conscious brain*

<https://www.quag.com/it/thread/26682/andy-clark-la-natura-incorporata-della-cognizione-umana-e-la-mente-estesa/>

Suppose you are sitting in the park...
Reading a book...
Relaxed and concentrated in your
reading

WHO/WHAT SAW THE BALL? WHAT ALLOWED US TO SEE THE BALL?

Something inside us saw the ball without us being conscious.

Our mind (our thinking ego) was slow; we recognize that a ball hit us, only when the ball has already hit us and is on the floor

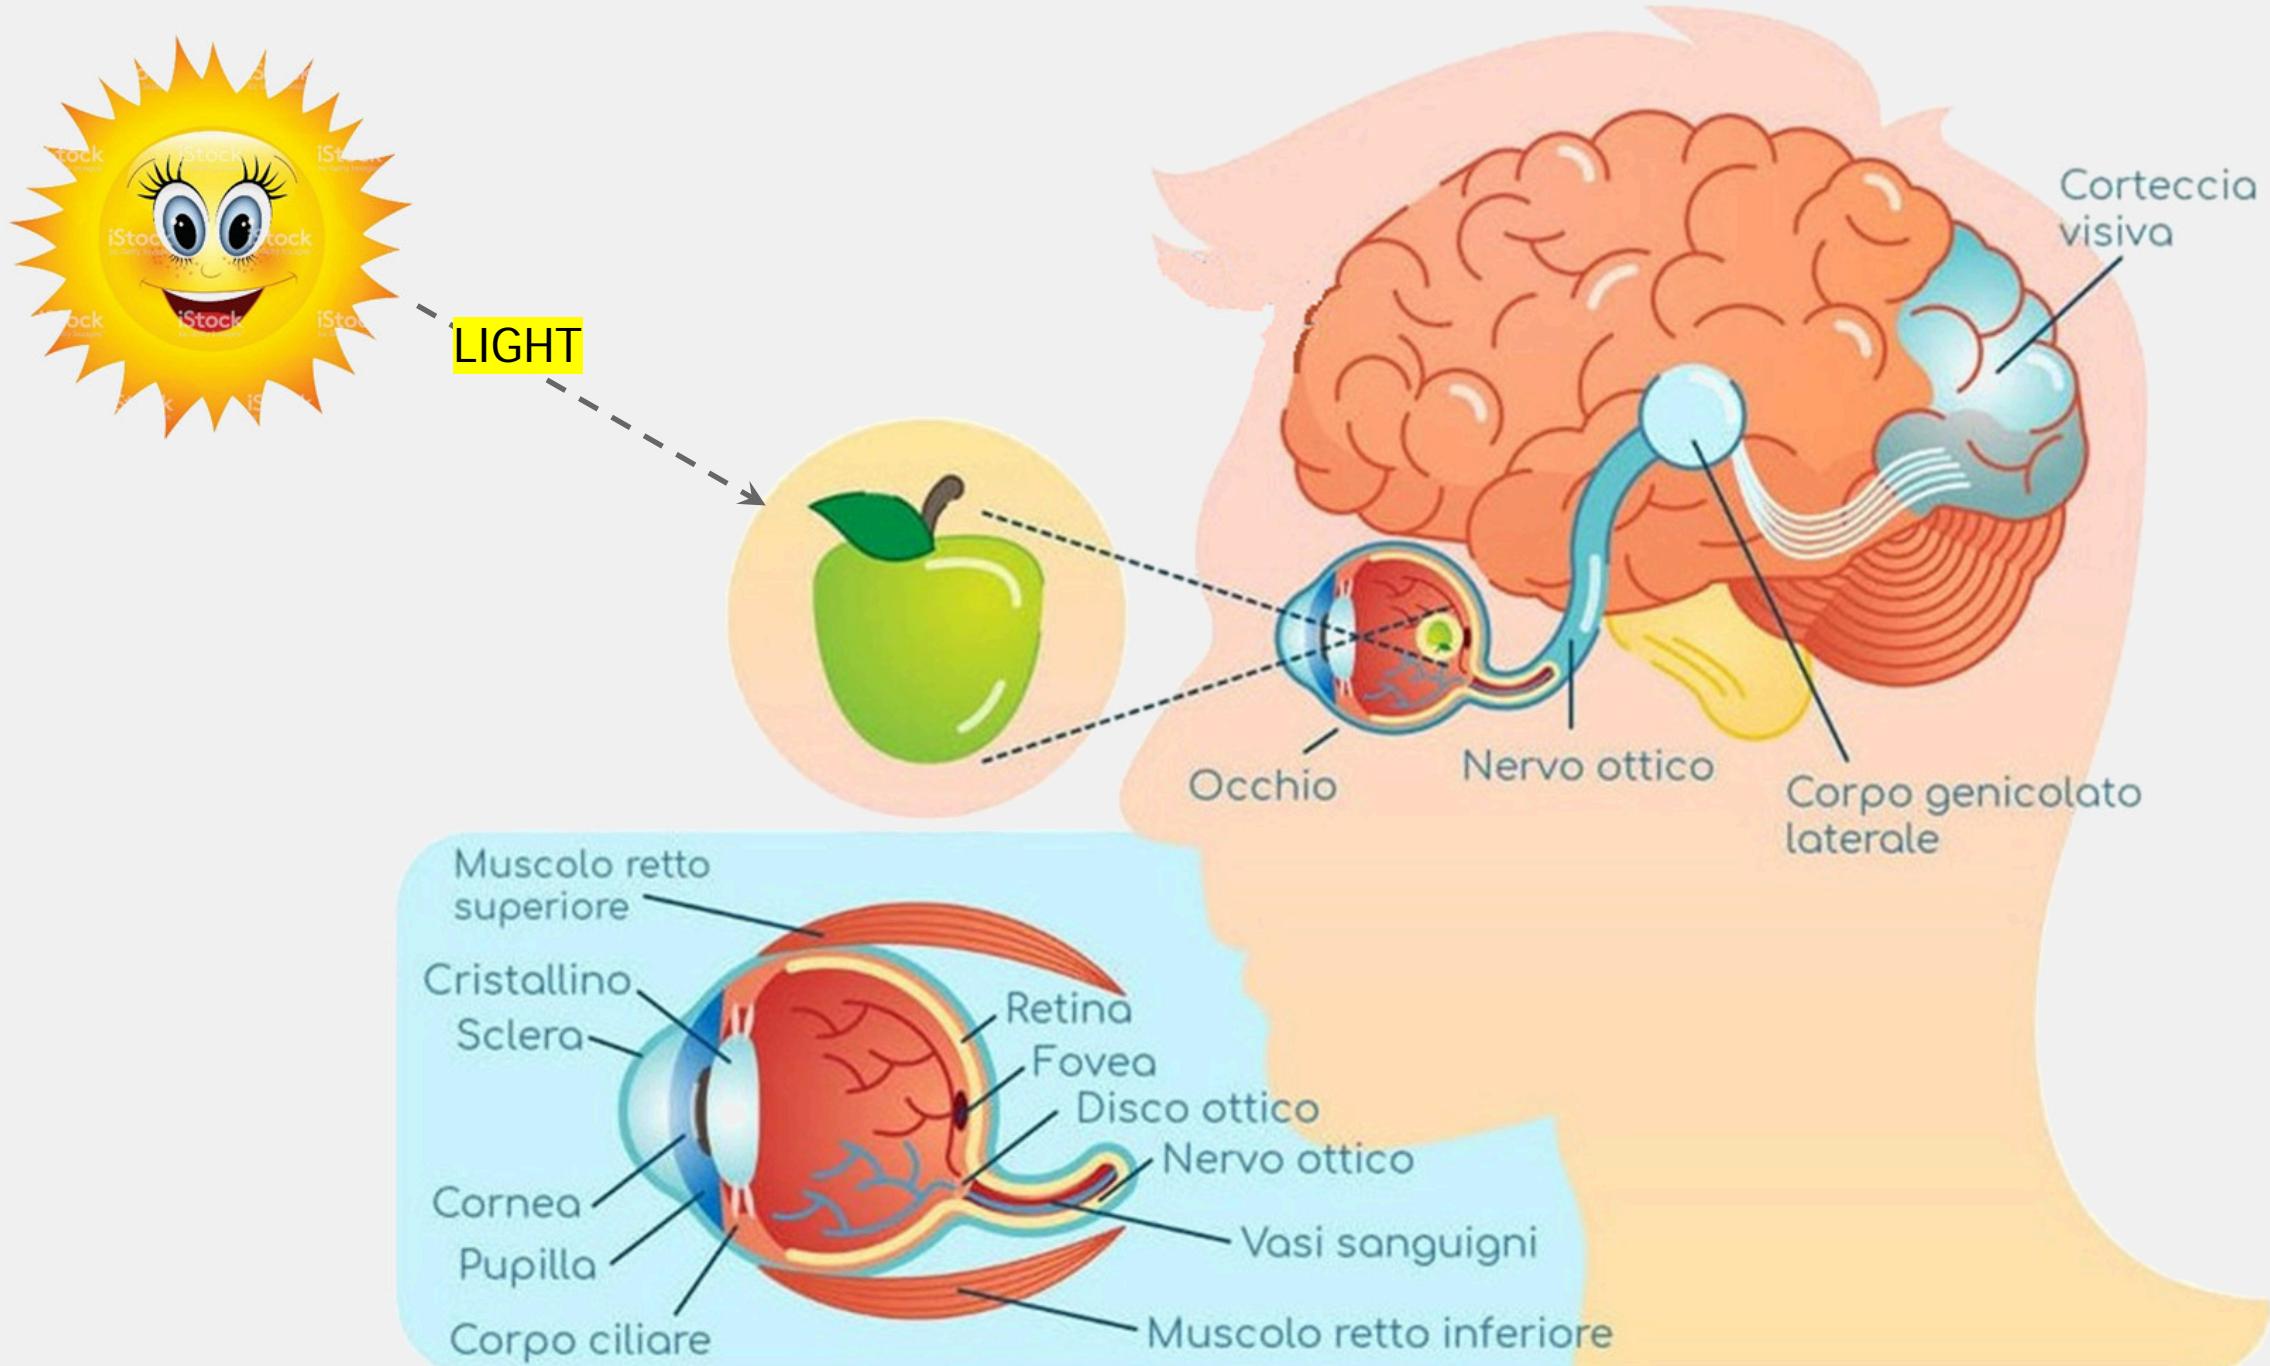

Therefore:

- Vision and Perception are fast, the mind is slow
- The brain is cartographer (IF it sees the ball, it knows where it is and how long it will approximately take before hitting us).
- Though connected, VISION, PERCEPTION, AND COGNITION are different phenomena
 - we see and perceive before having any cognition

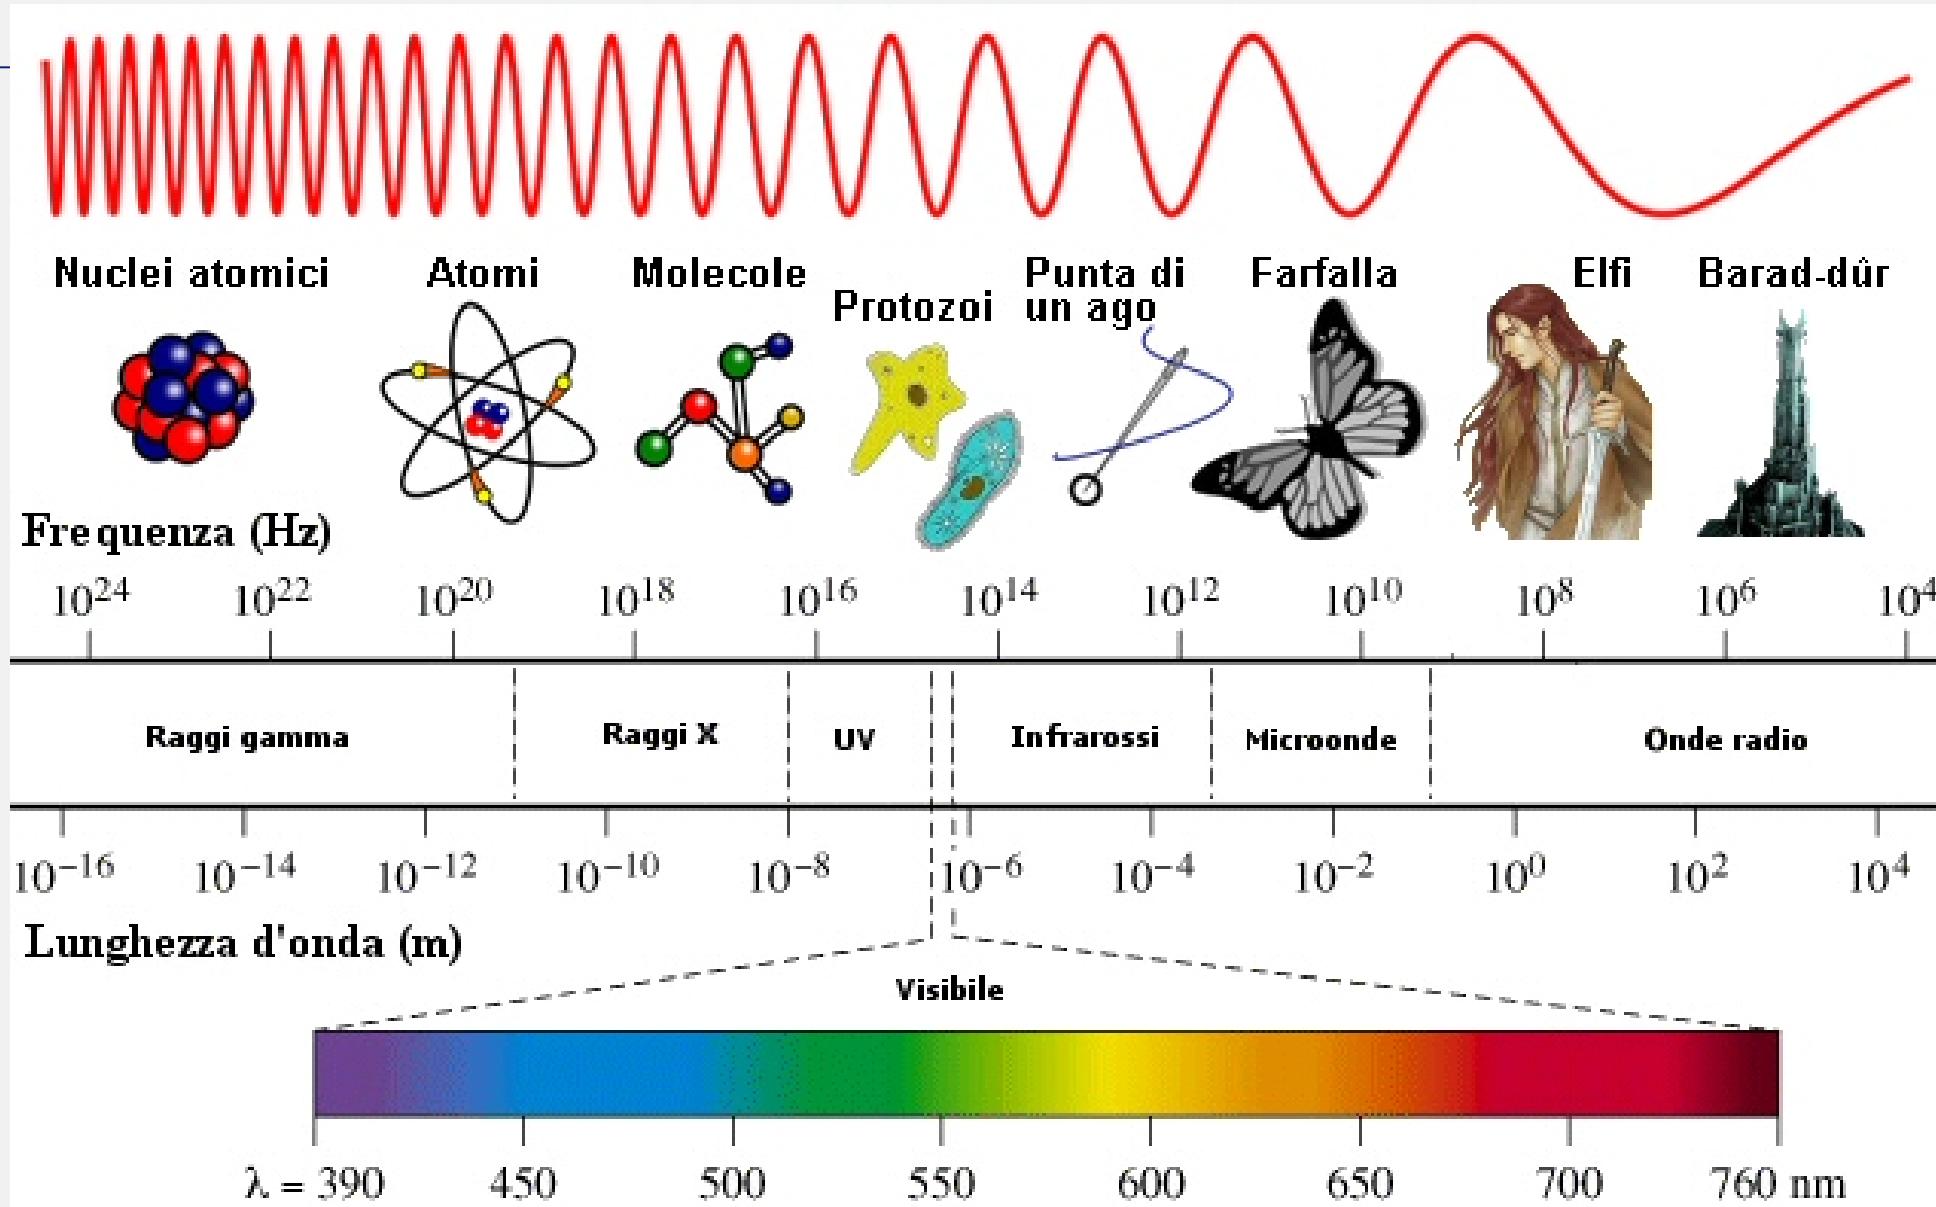

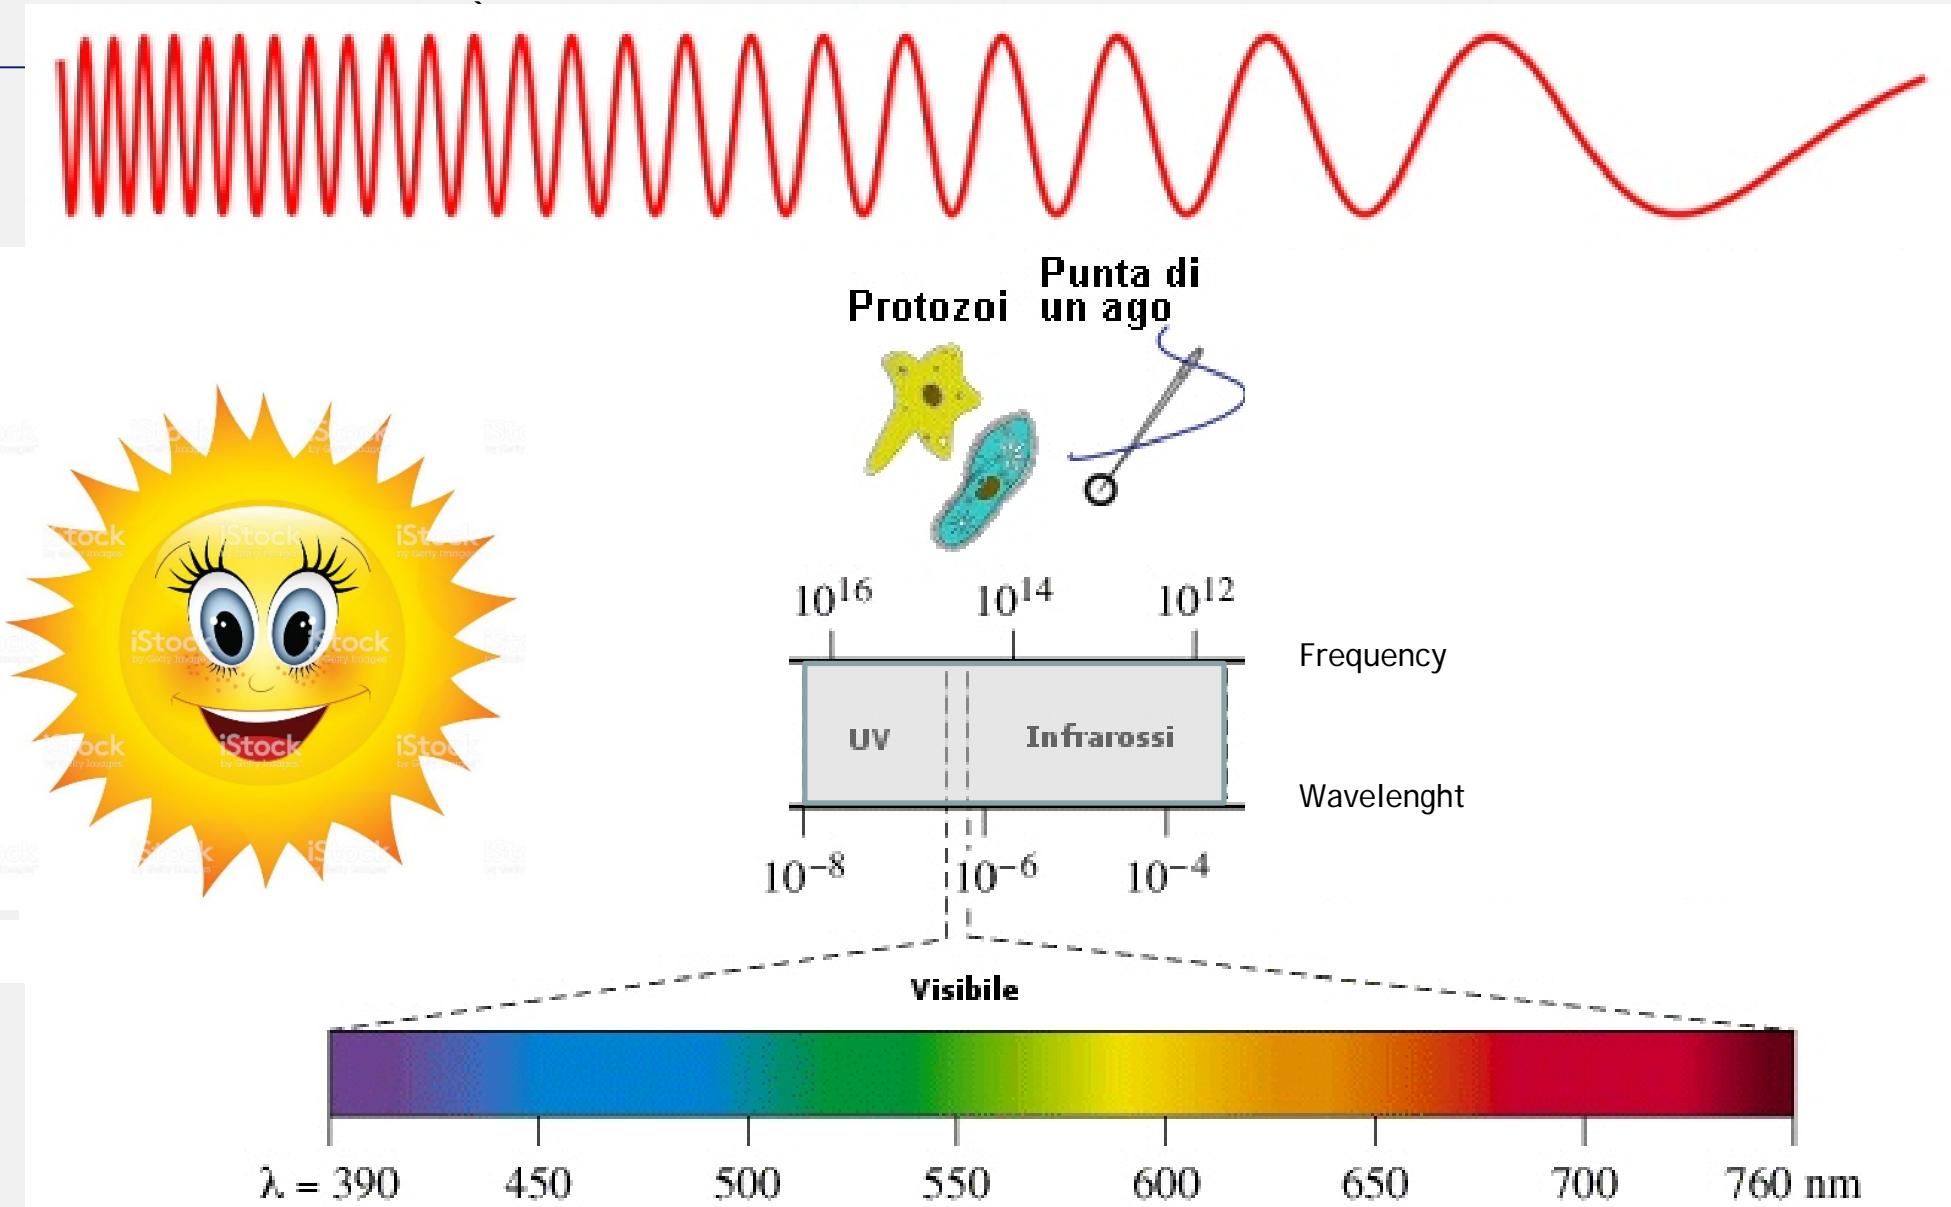

HOW ARE VISION / PERCEPTION / MIND INTERACTING AND
COMMUNICATING TO LET US FORM OUR COGNITION?

La luce è una Onda/radiazione elettromagnetica

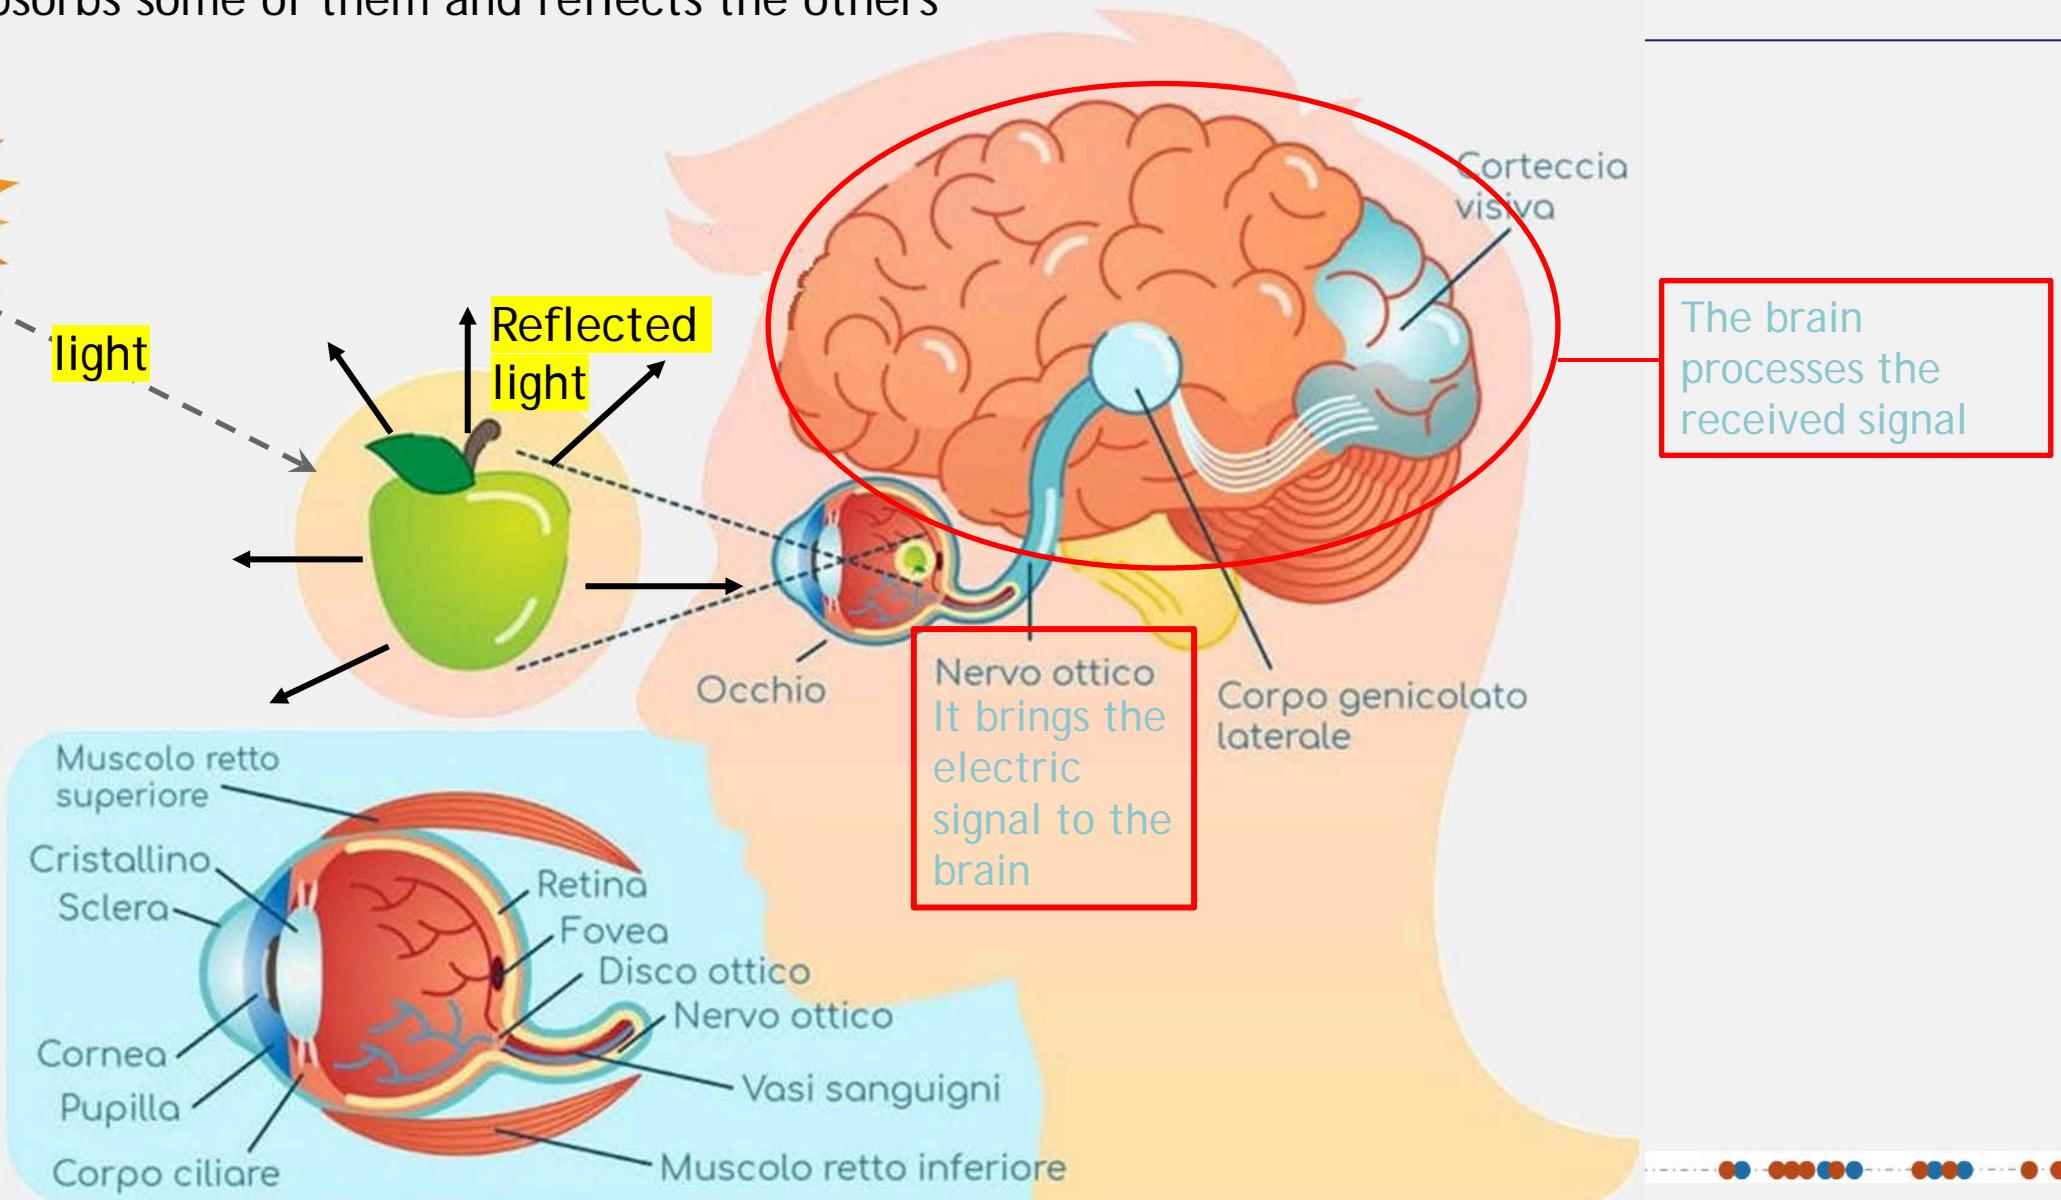

Tra tutte le onde elettromagnetiche la luce solare

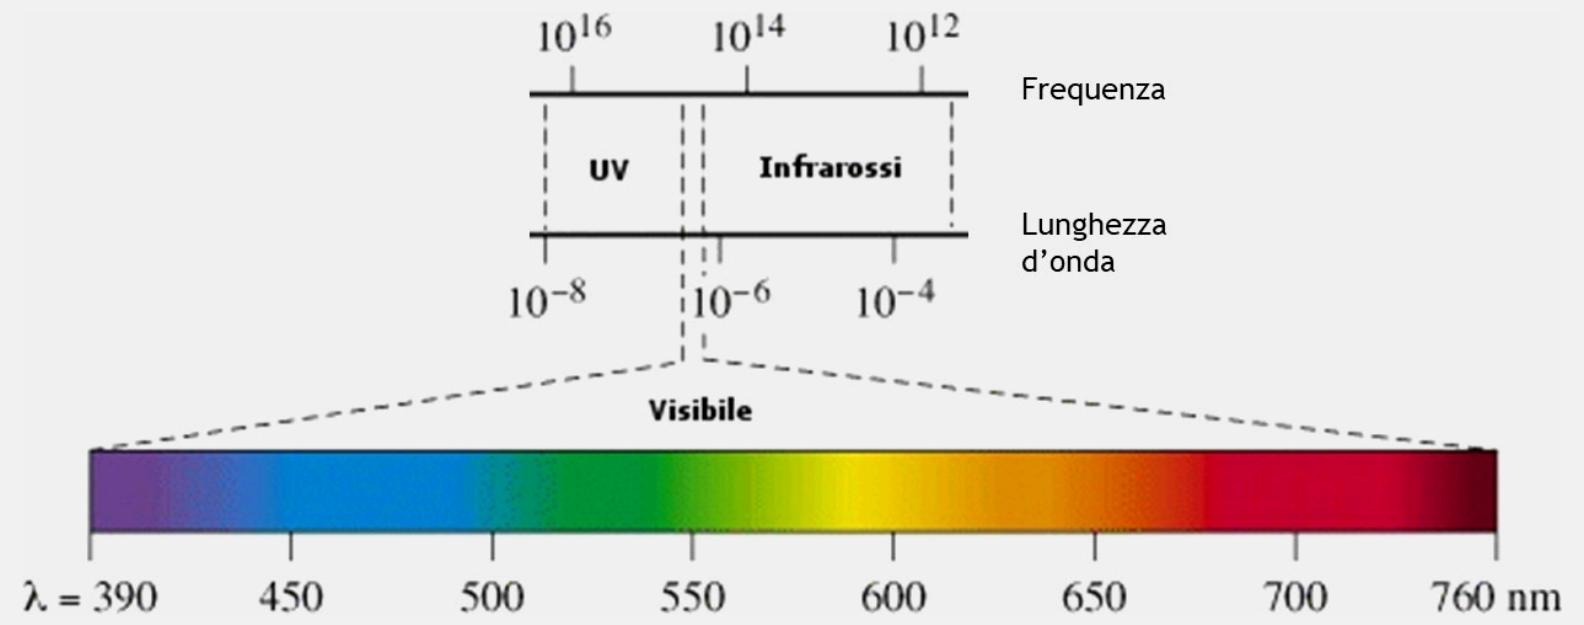

Radiations from light (fotoni) hit the object that absorbs some of them and reflects the others

We see only a small portion of the light radiation (visible light)

- blu-violet radiations (400-490 nm);
- green radiations (490-560 nm);
- yellow radiations (560-590 nm);
- red-orange radiations (590-700 nm).

white eye protection

Eye Anatomy

iris: is a muscle that lets more or light to enter the eye

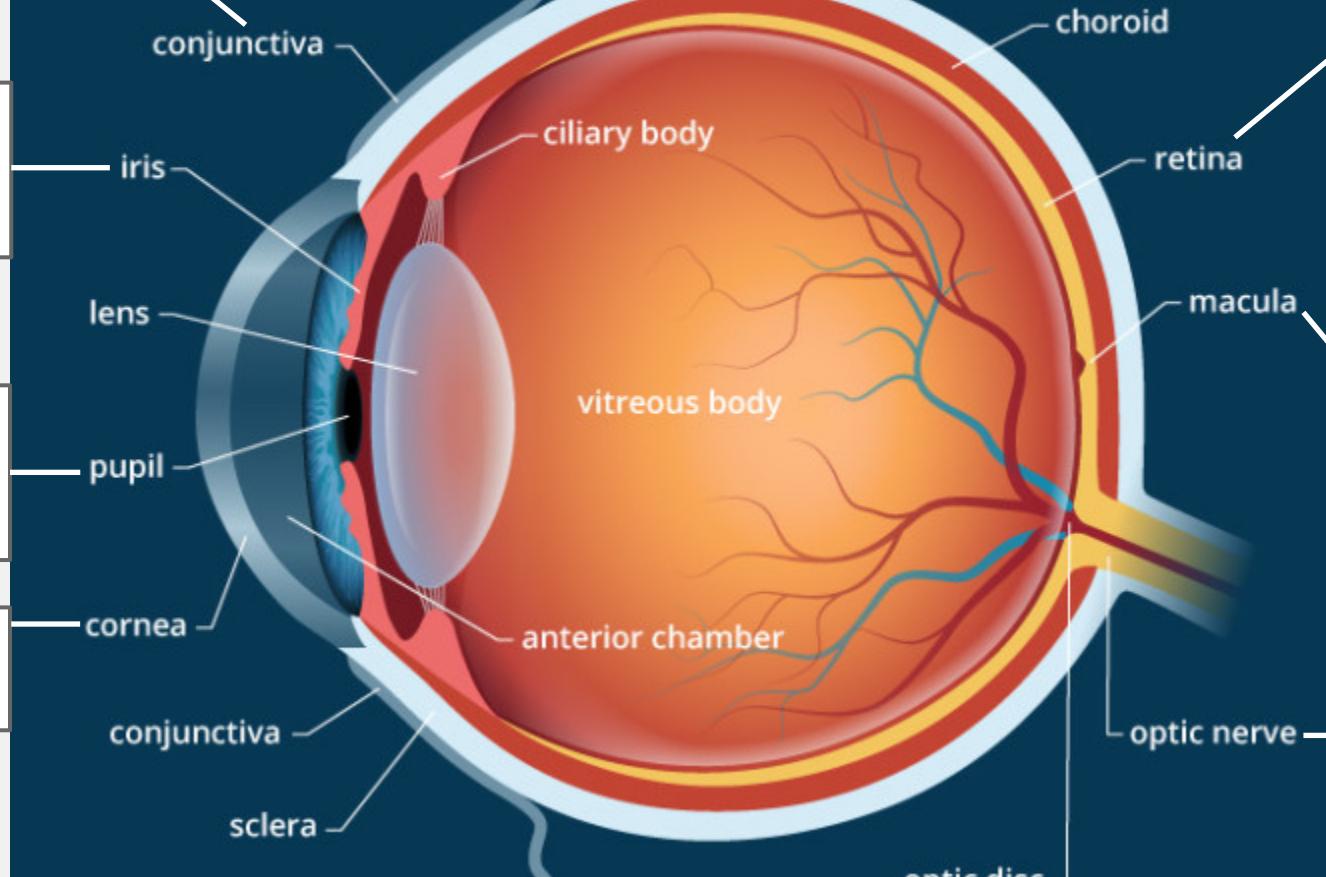

Together with iris functions like the camera objective

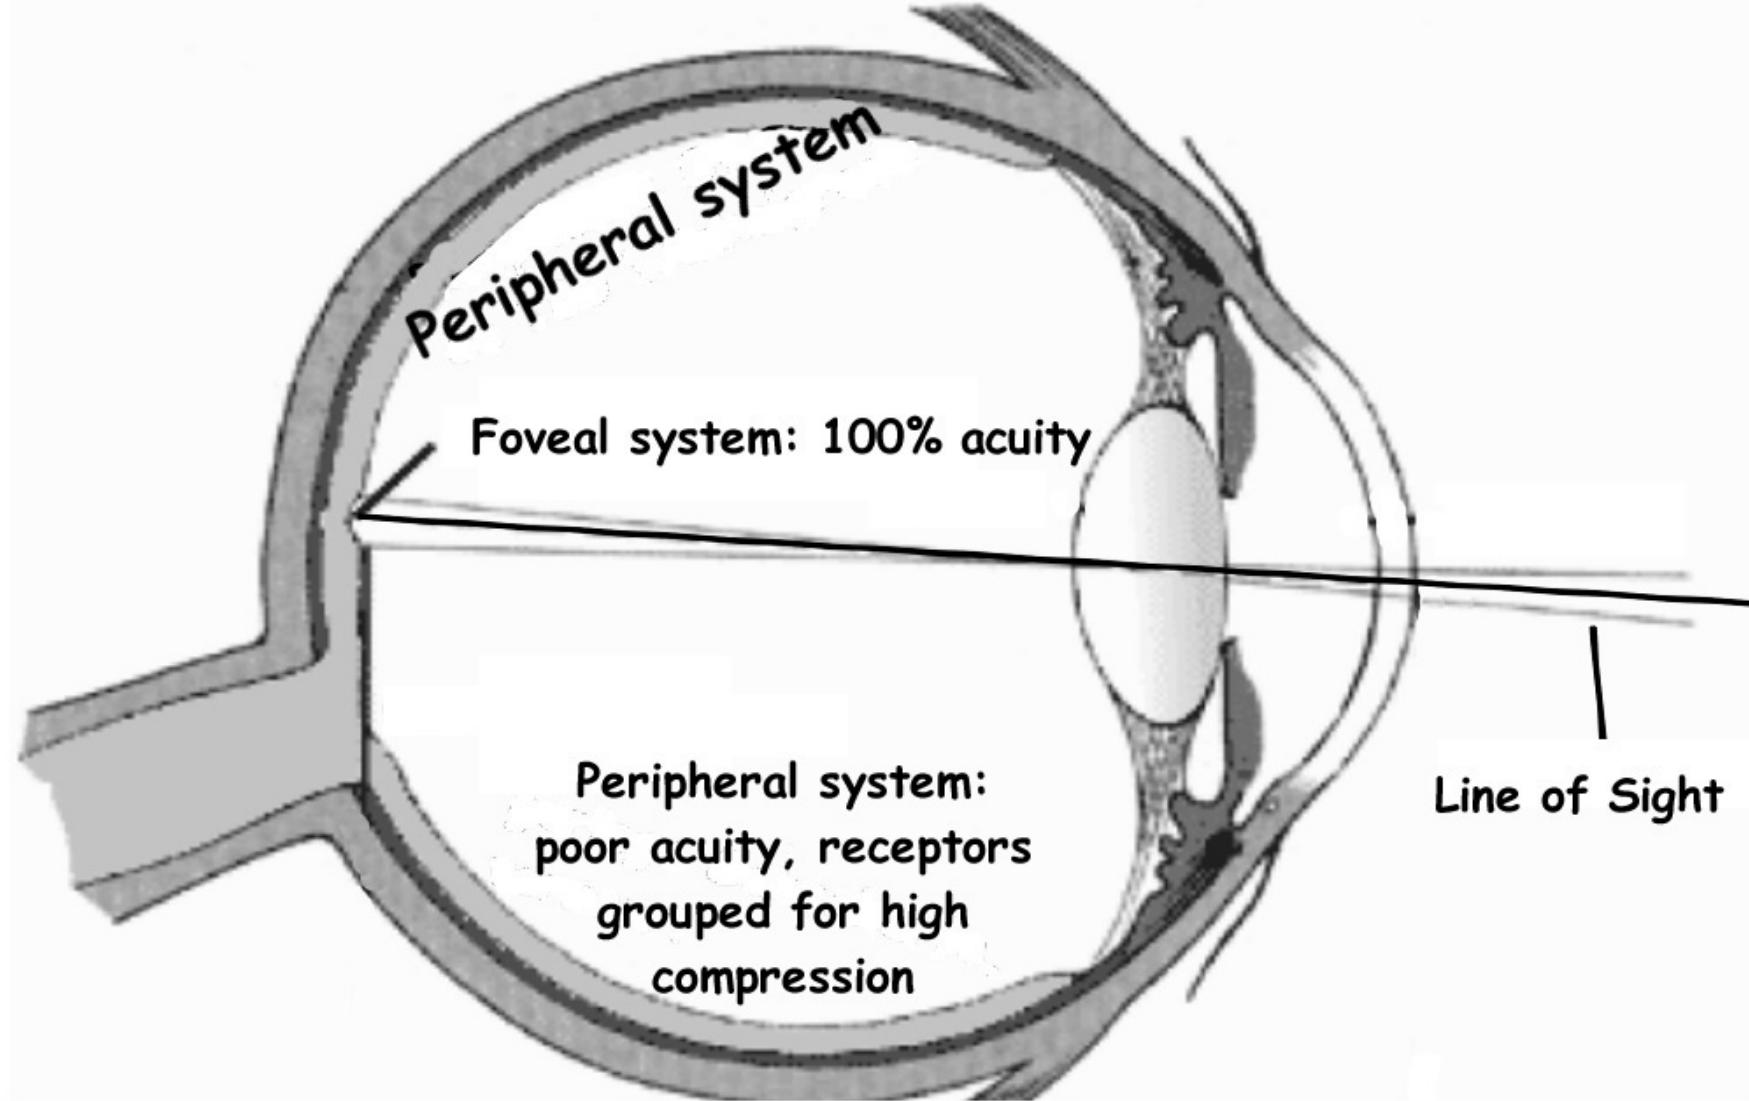

Cornea: protective lens

it is a part of the brain. It contains fotoreceptors for colors (cones) and light/dark (bast

(Fovea) A small part where most of all the photoreceptors are.

Brings stimuli to the brain

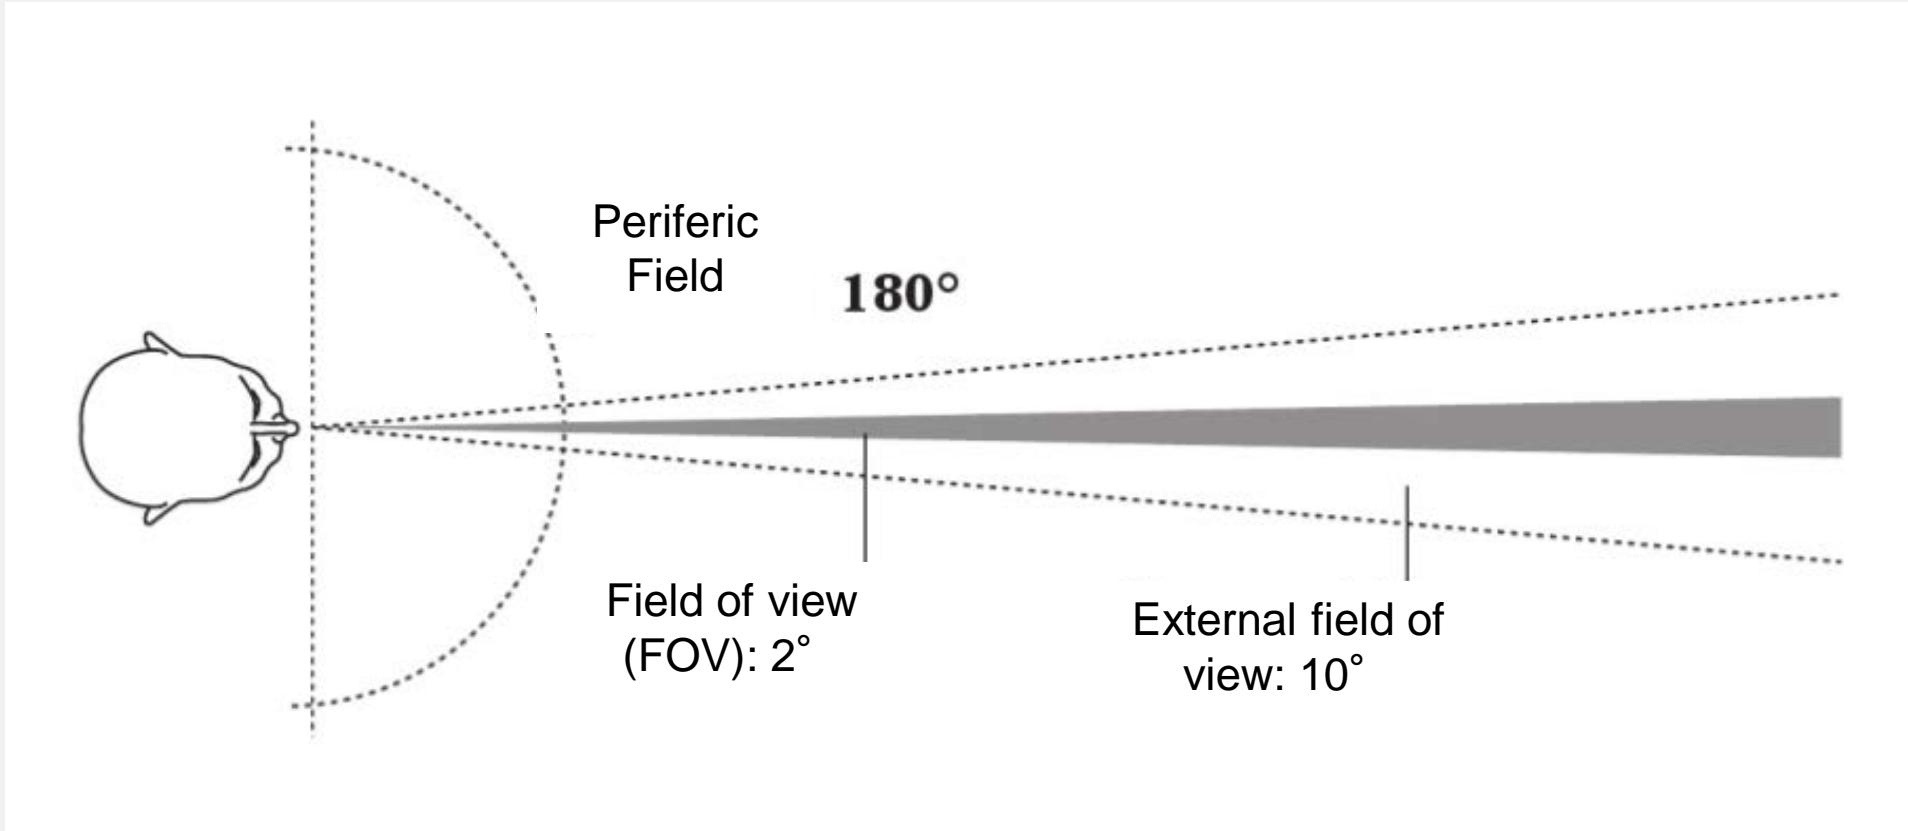

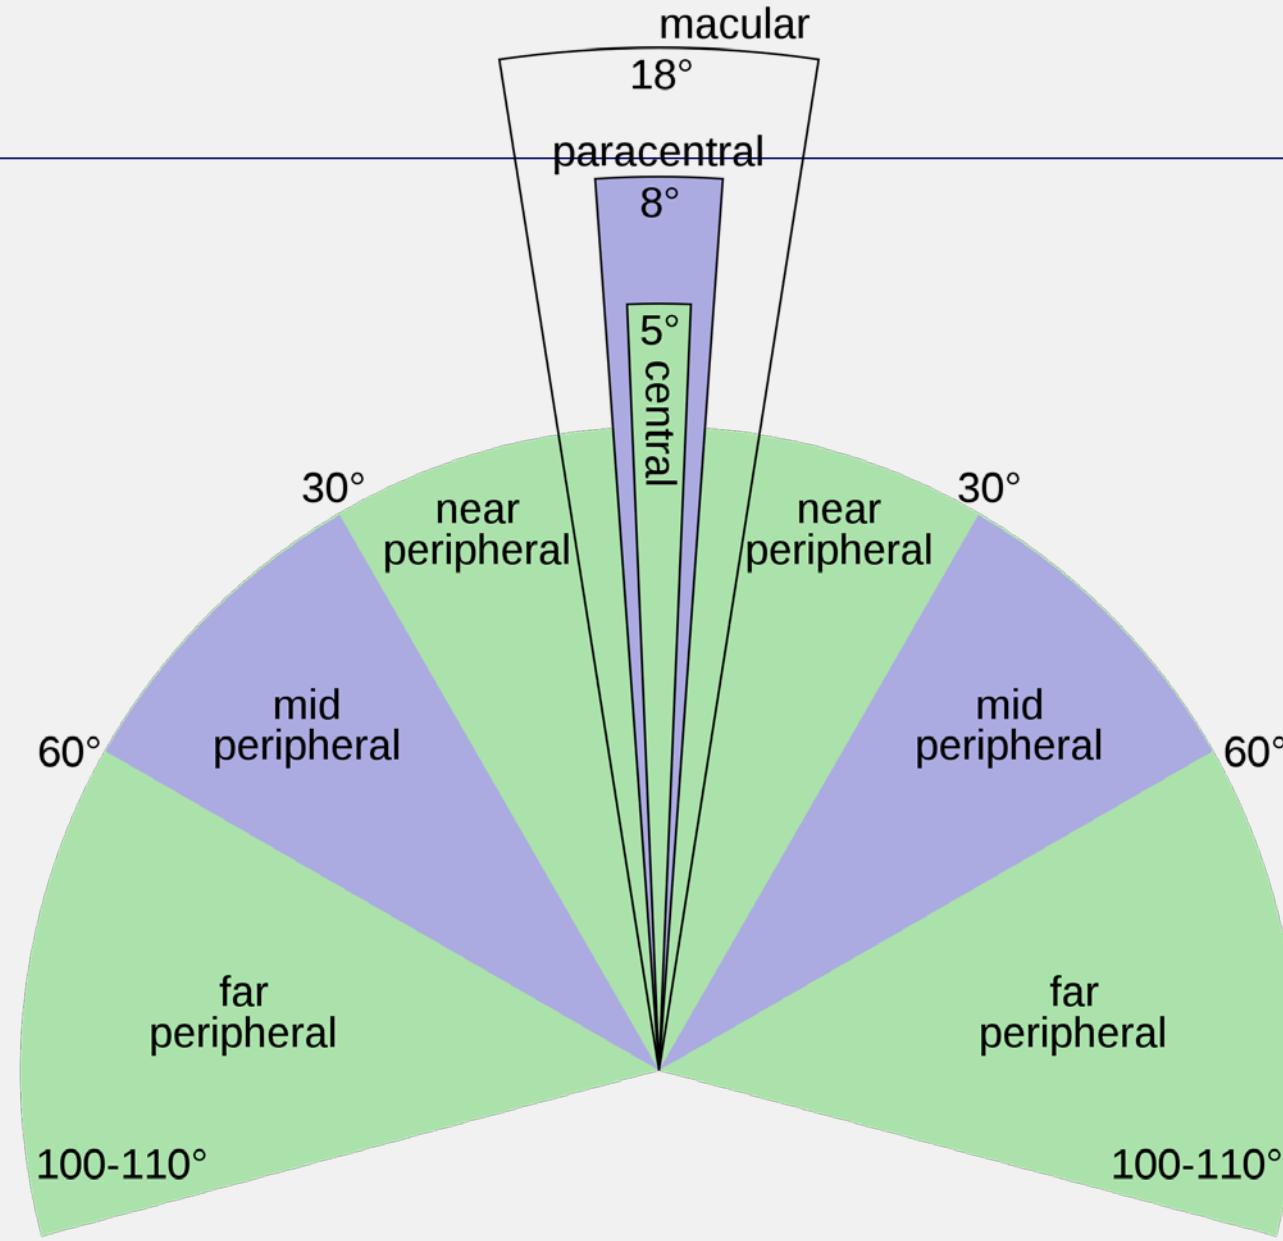

Peripheral system for general holistic impression of the situation.
Foveal system for high quality details.

Foveal vision

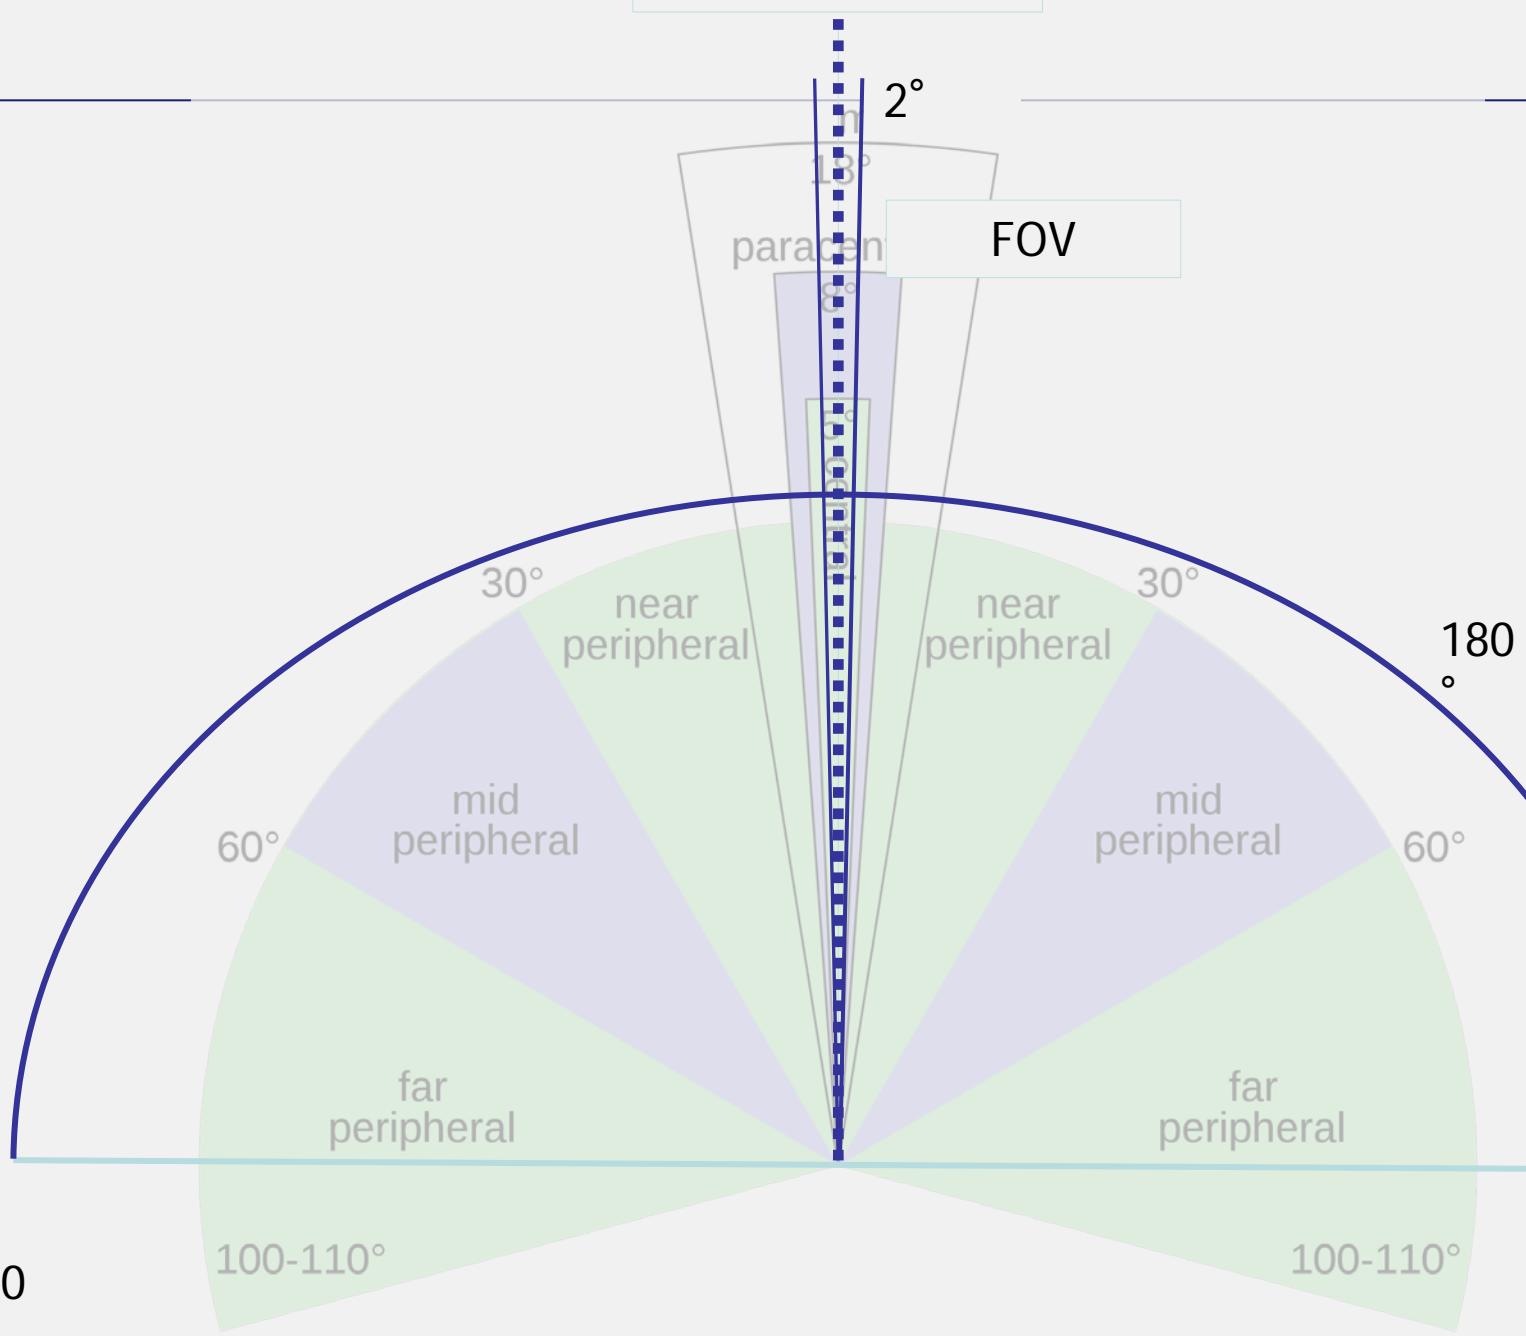

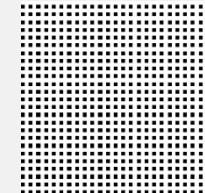

3/30/2020

Fixation Point

To view details we close the lens to let less light enter into the eye.
Light concentrates into the fovea.
In this way we are able to see 625 points in 1 square inch (2.54 square cm).
[Edward Tufte (2001). *The visual display of quantitative Information*]

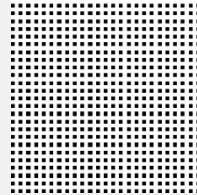

25 points in 1''

25 points in 1''

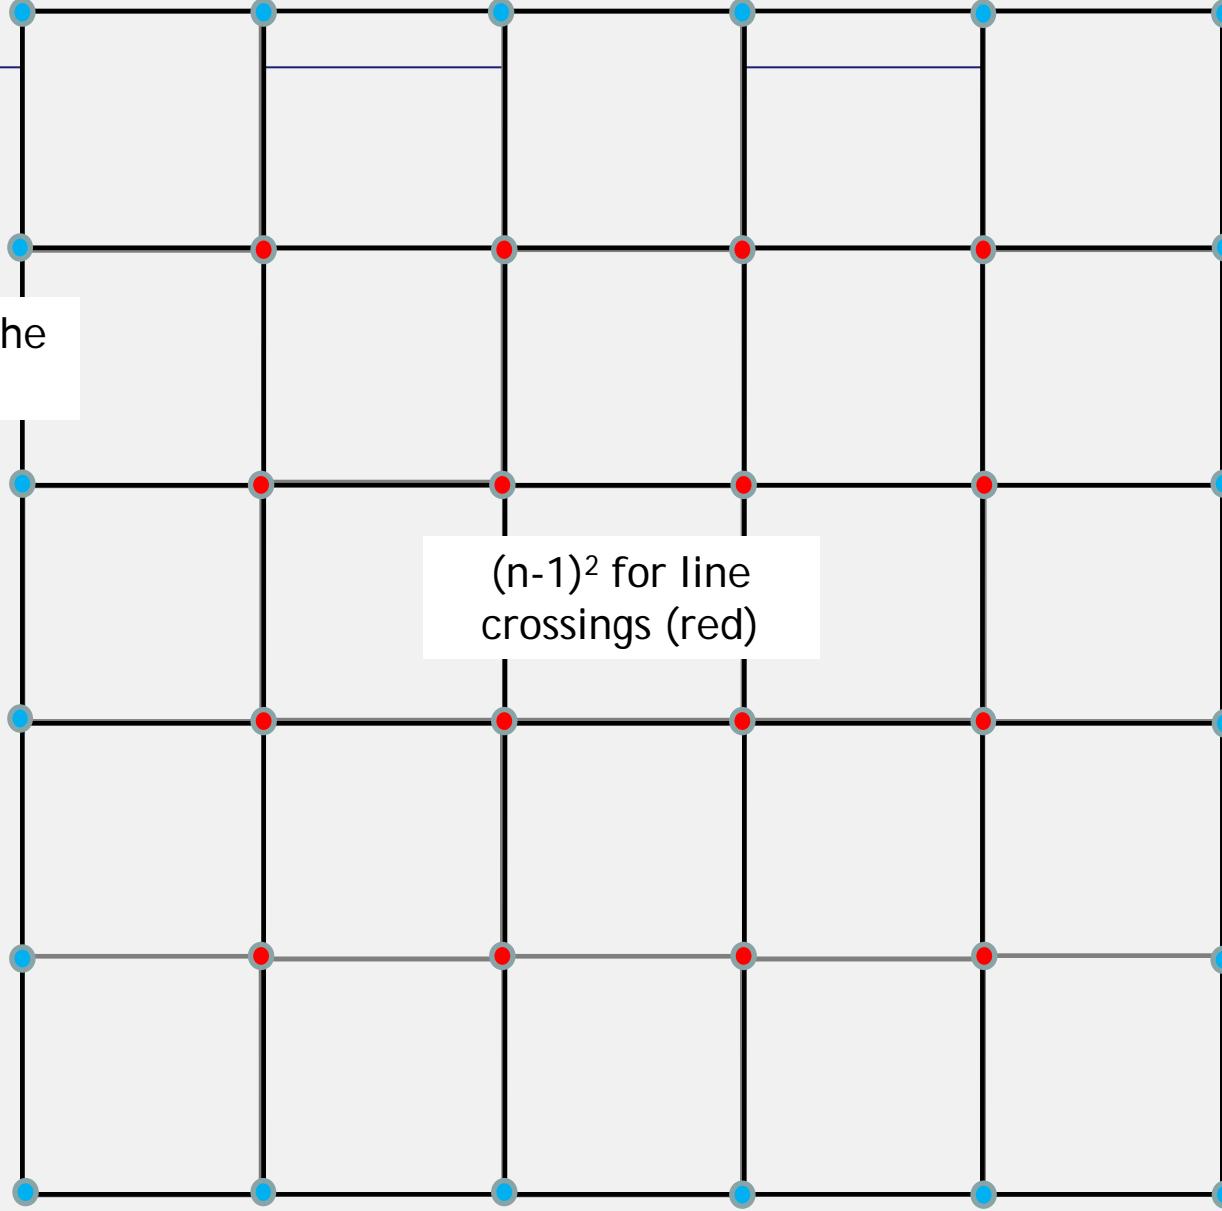

Griglia $n \times n = 25 \times 25$ in 1''

25 black squares and 26 = white squares for each line

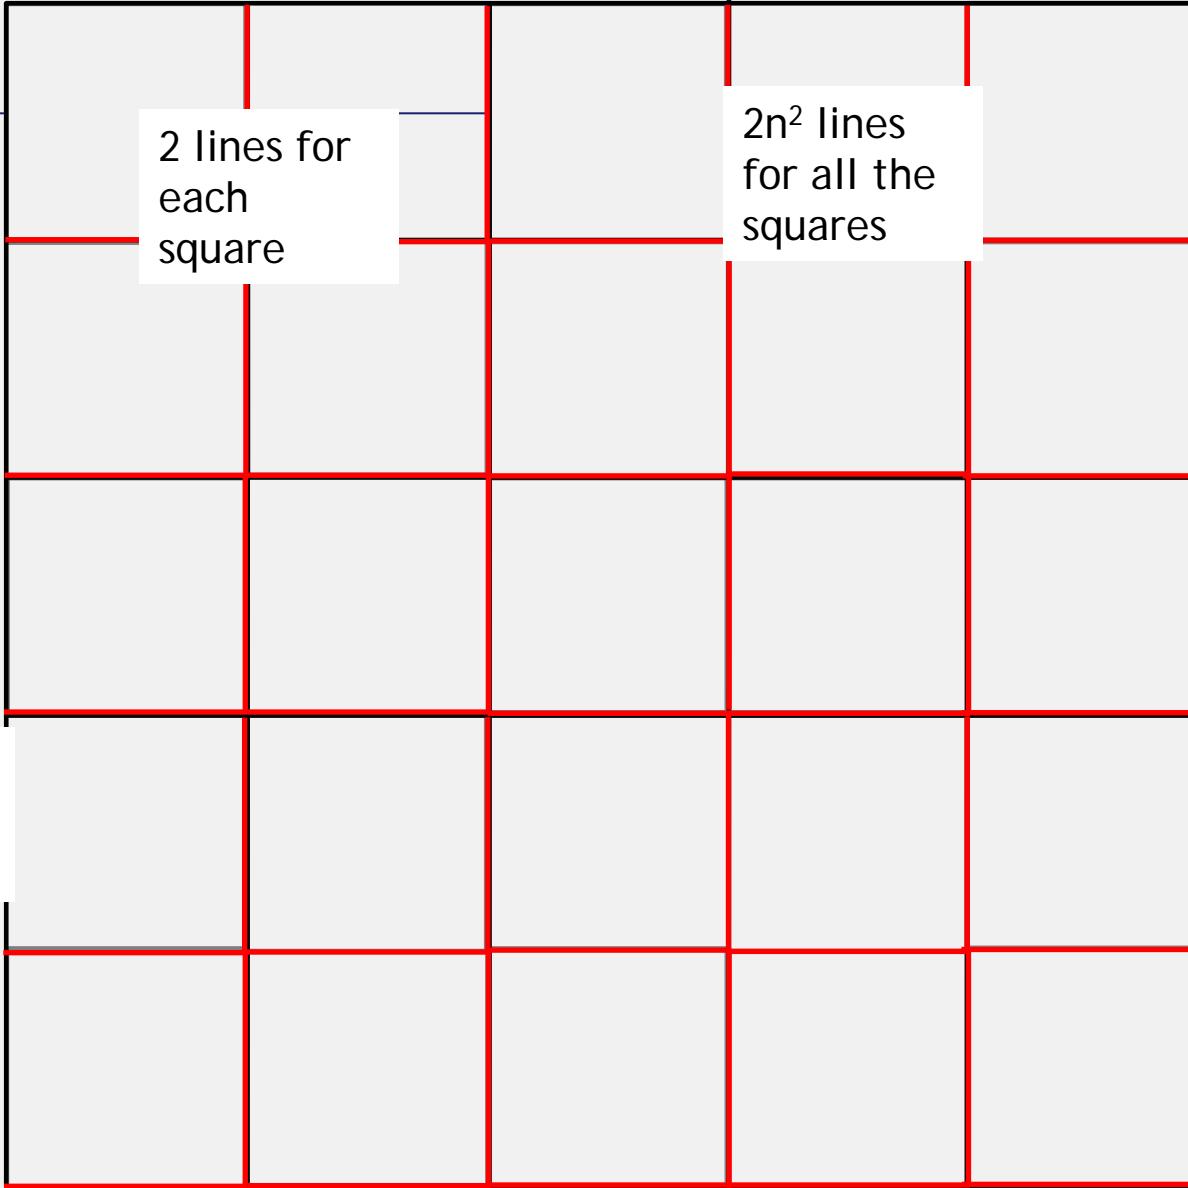

How many details can I see?

$2n$ lines for
two external
lines

$$2n^2 + 2 \cdot n = 2n(n+1) \text{ lines}$$

Therefore

$(n+1)^2$ crosses

$2n(n+1)$ lines

Ovvero vedo:

$3n^2 + 6n + 1$ details

which is

$$3 * 25^2 + 6 * 25 + 1 = \text{dettagli}$$

2050 details

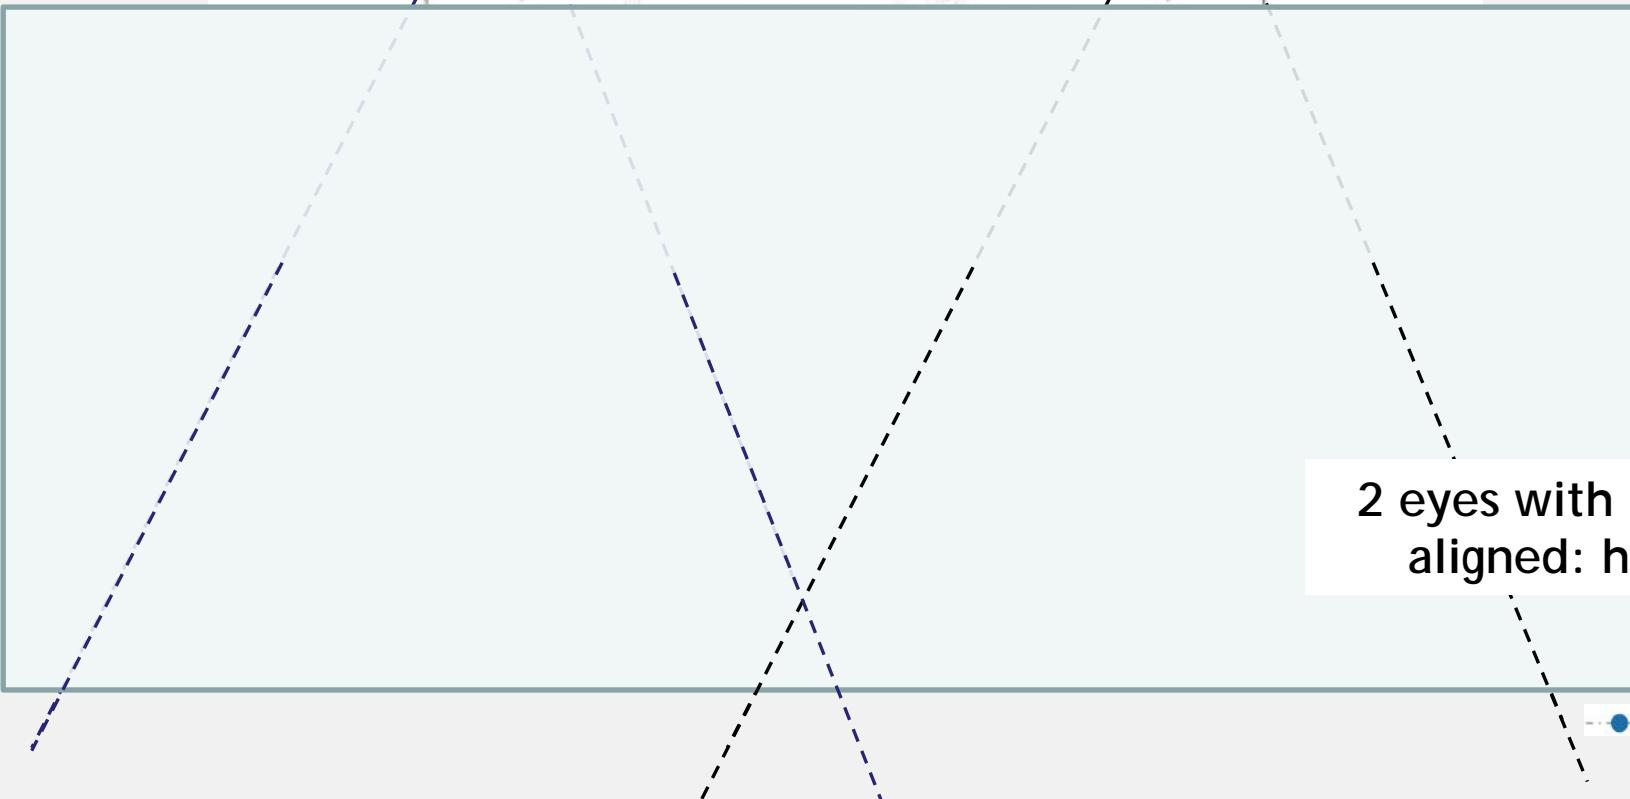

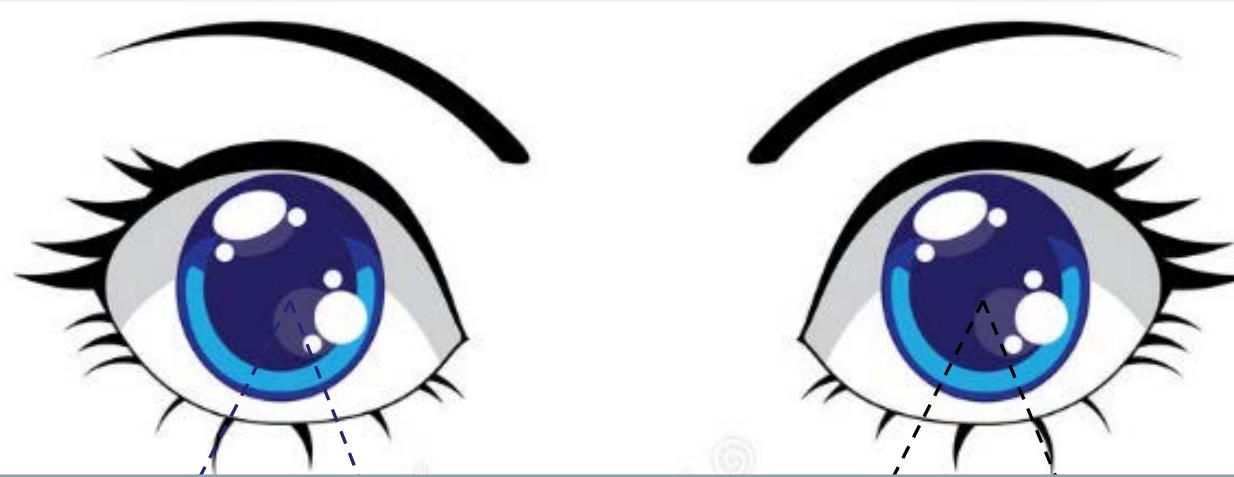

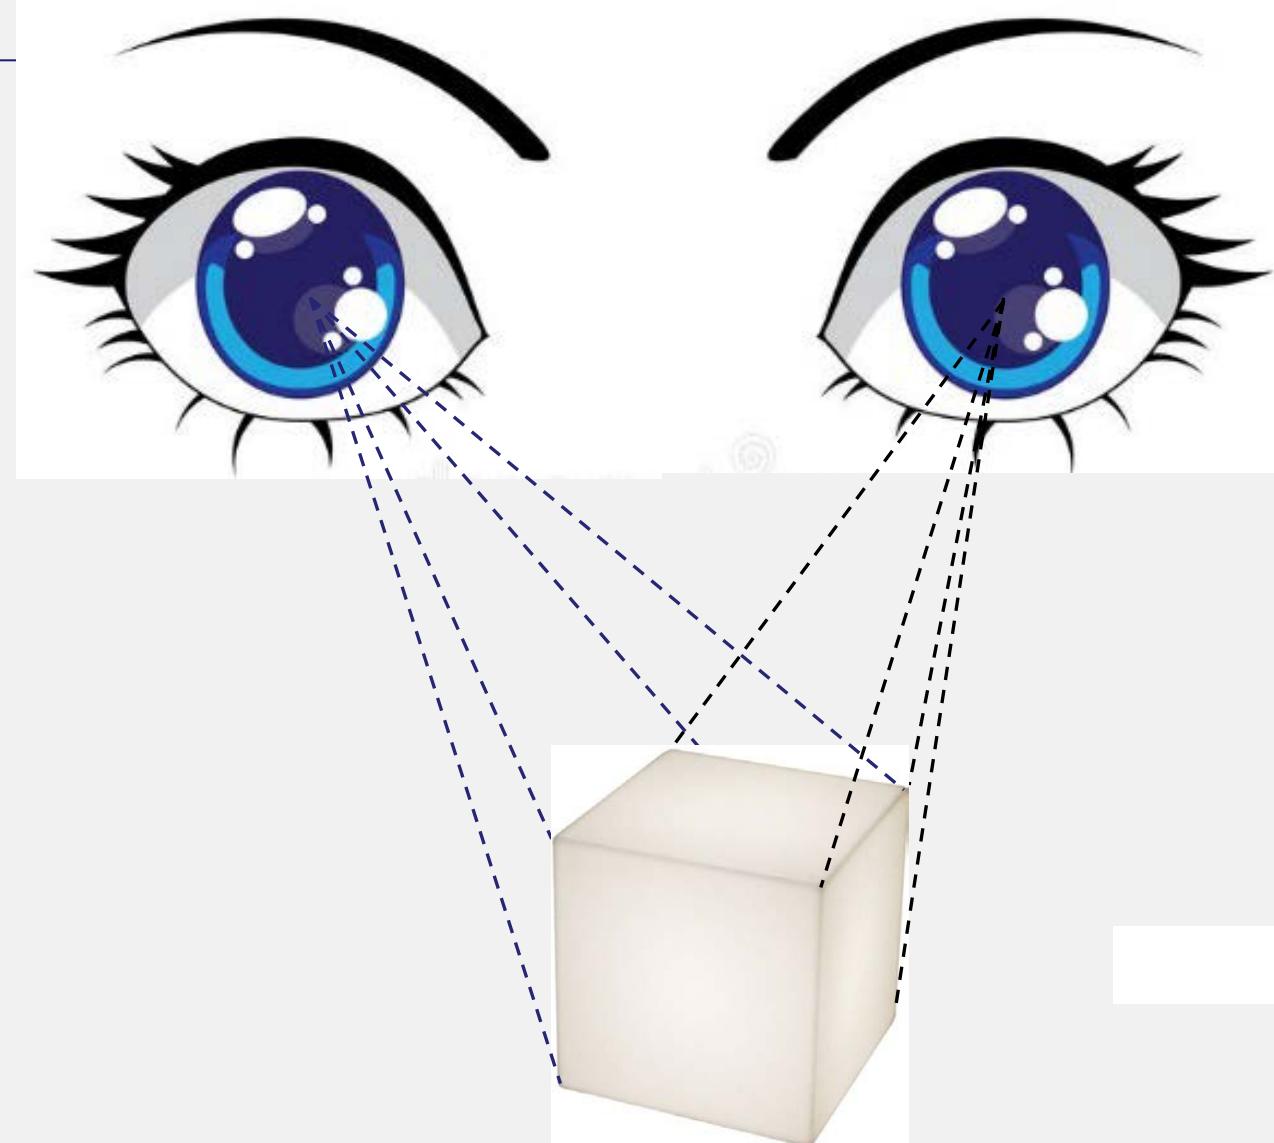

This is all seen through stimuli going through macula in the left and right eye

Mind that we have two eyes: fovea (right eye) + fovea (left eye)

The combination of such stimuli produces:

- Horizontal, peripheral view
- 3D view

2 eyes: 3D view

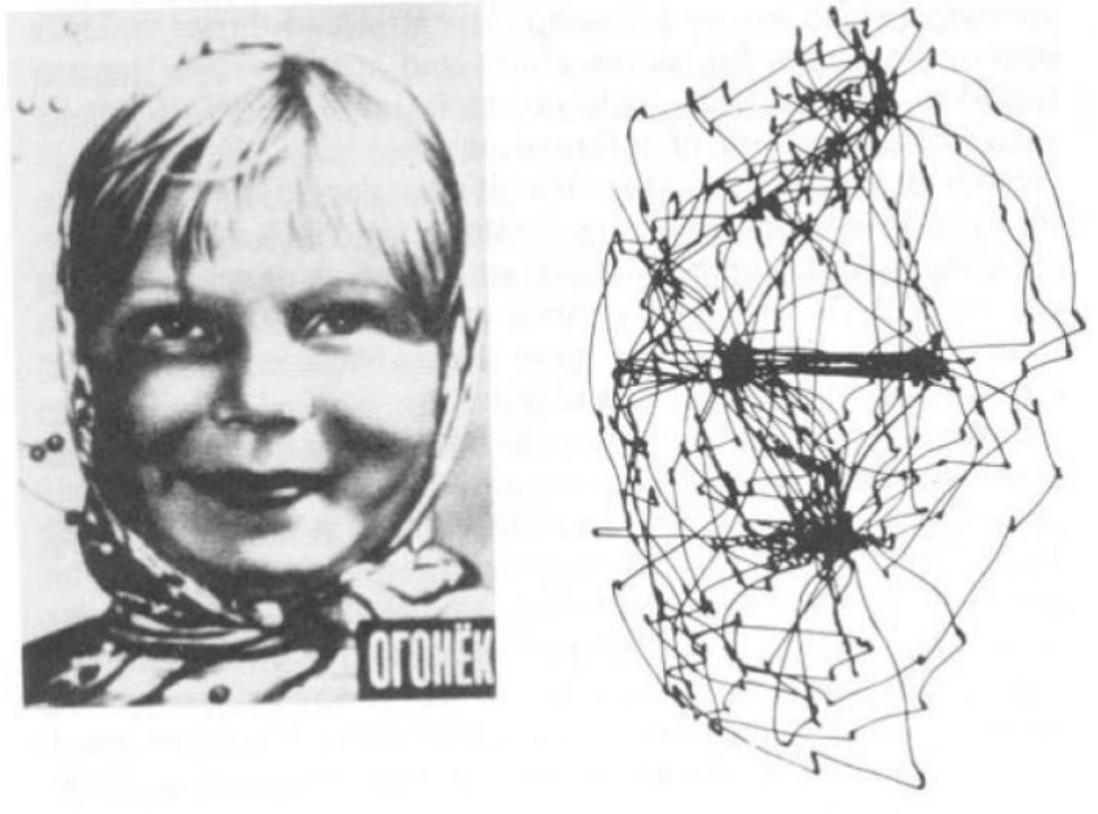

The blind spot

SACCADIC movements: eye move with a frequency of 2-3 movements per second
Fixations: when eyes stop on the scene

An experiment:
Movement of the eyes

Fixations are on Spots containing points of interest (Pols)

Spots with Pols:

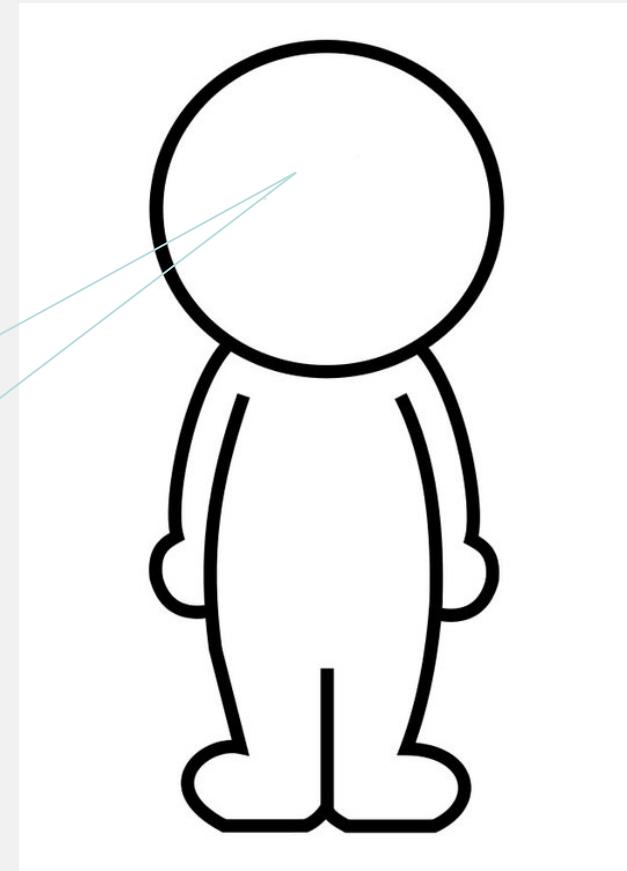

- contain lots of details (high frequency points)
 - lot of text in the document creates low frequencies. Eyes don't stop
 - In the desert, a unique advertisement would make your eyes stop on it
- where details are clearer
 - differing fonts for text have different effects
- contain uncommon shapes, or moving (living) shapes
- contain bright/saturated colors

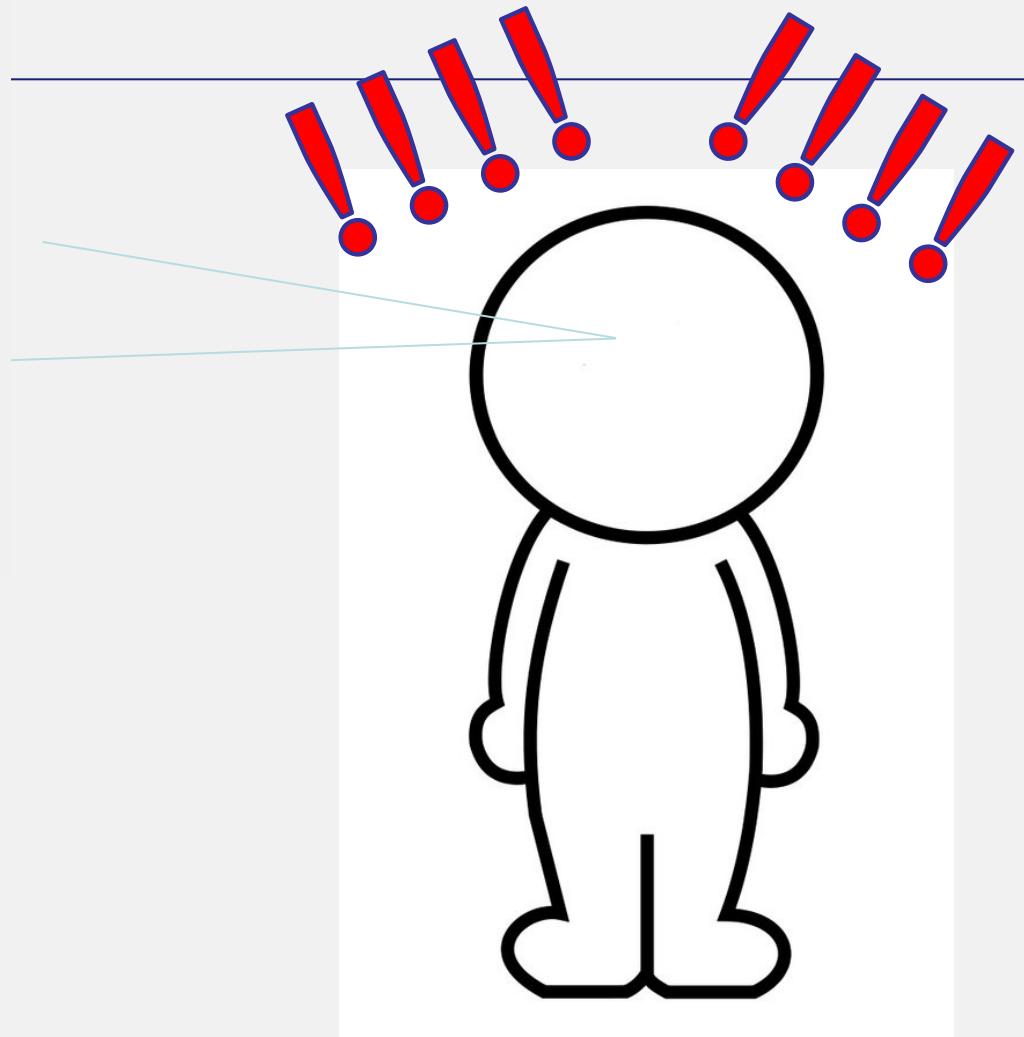

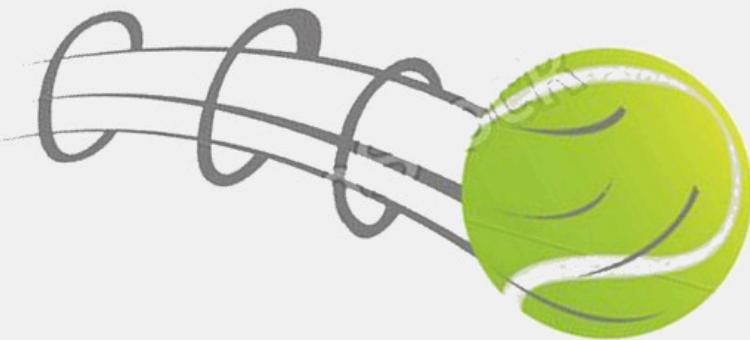

Ma se i punti di interesse sono

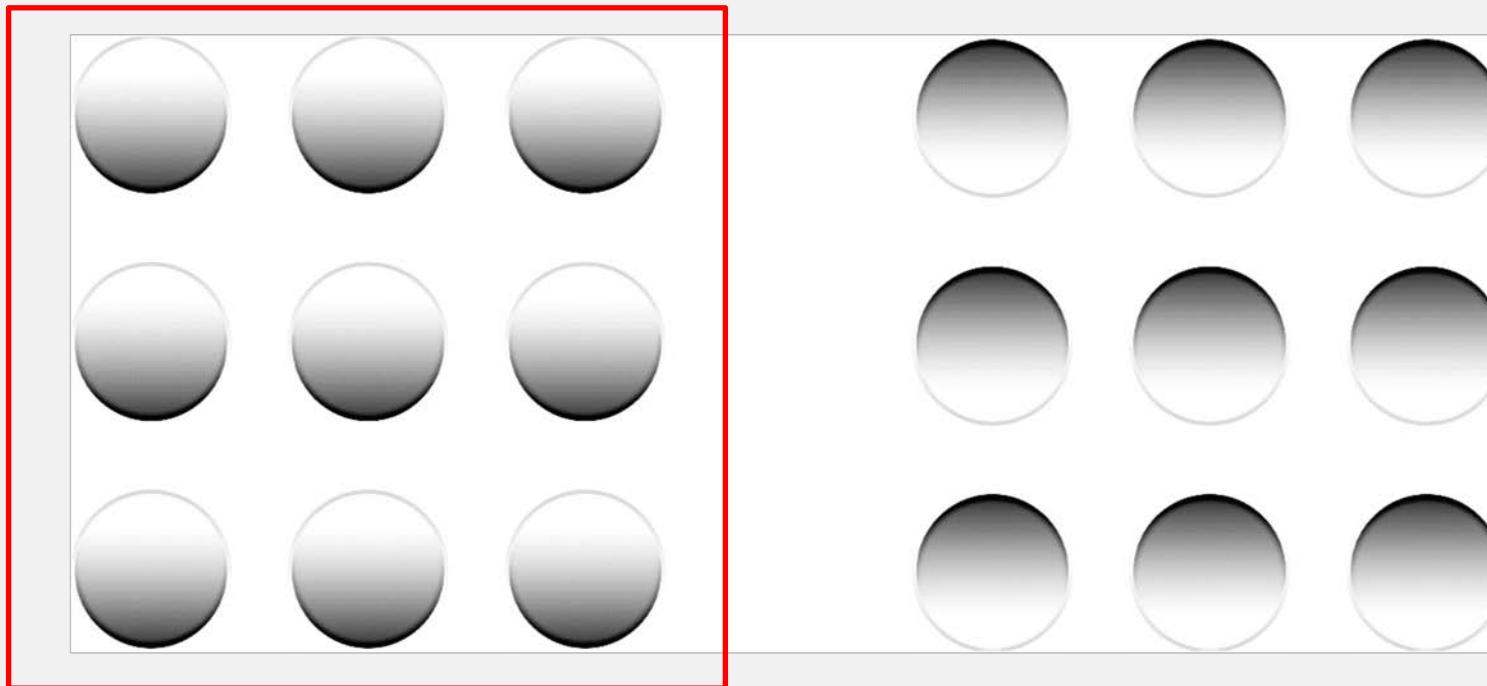

**VISION IS NOT PERCEPTION
BUT
PERCEIVING ALLOWS SEEING**

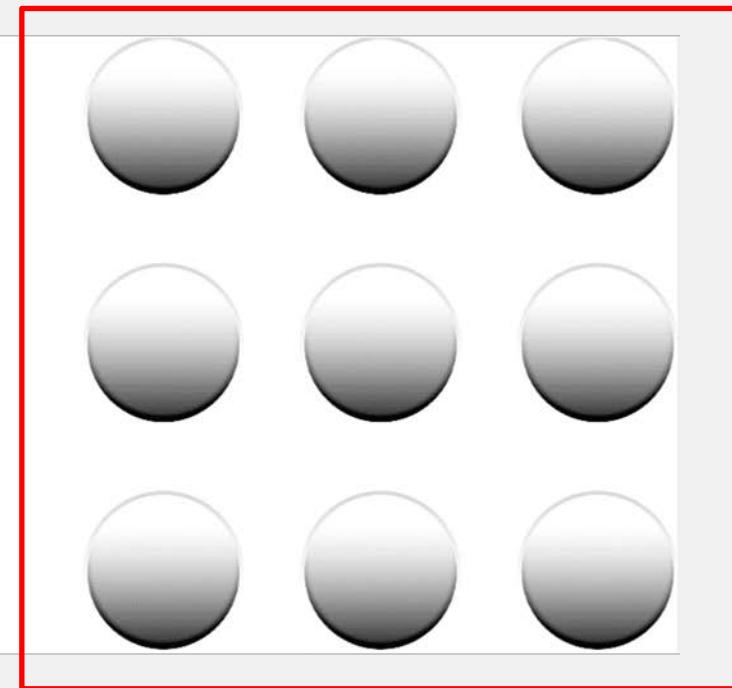

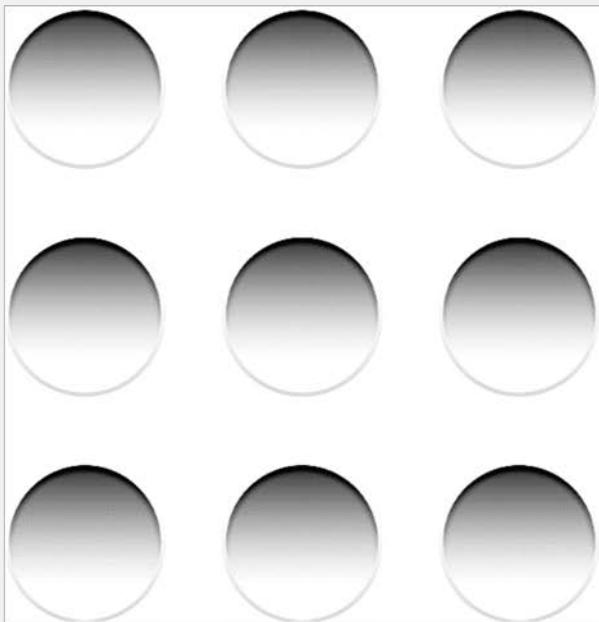

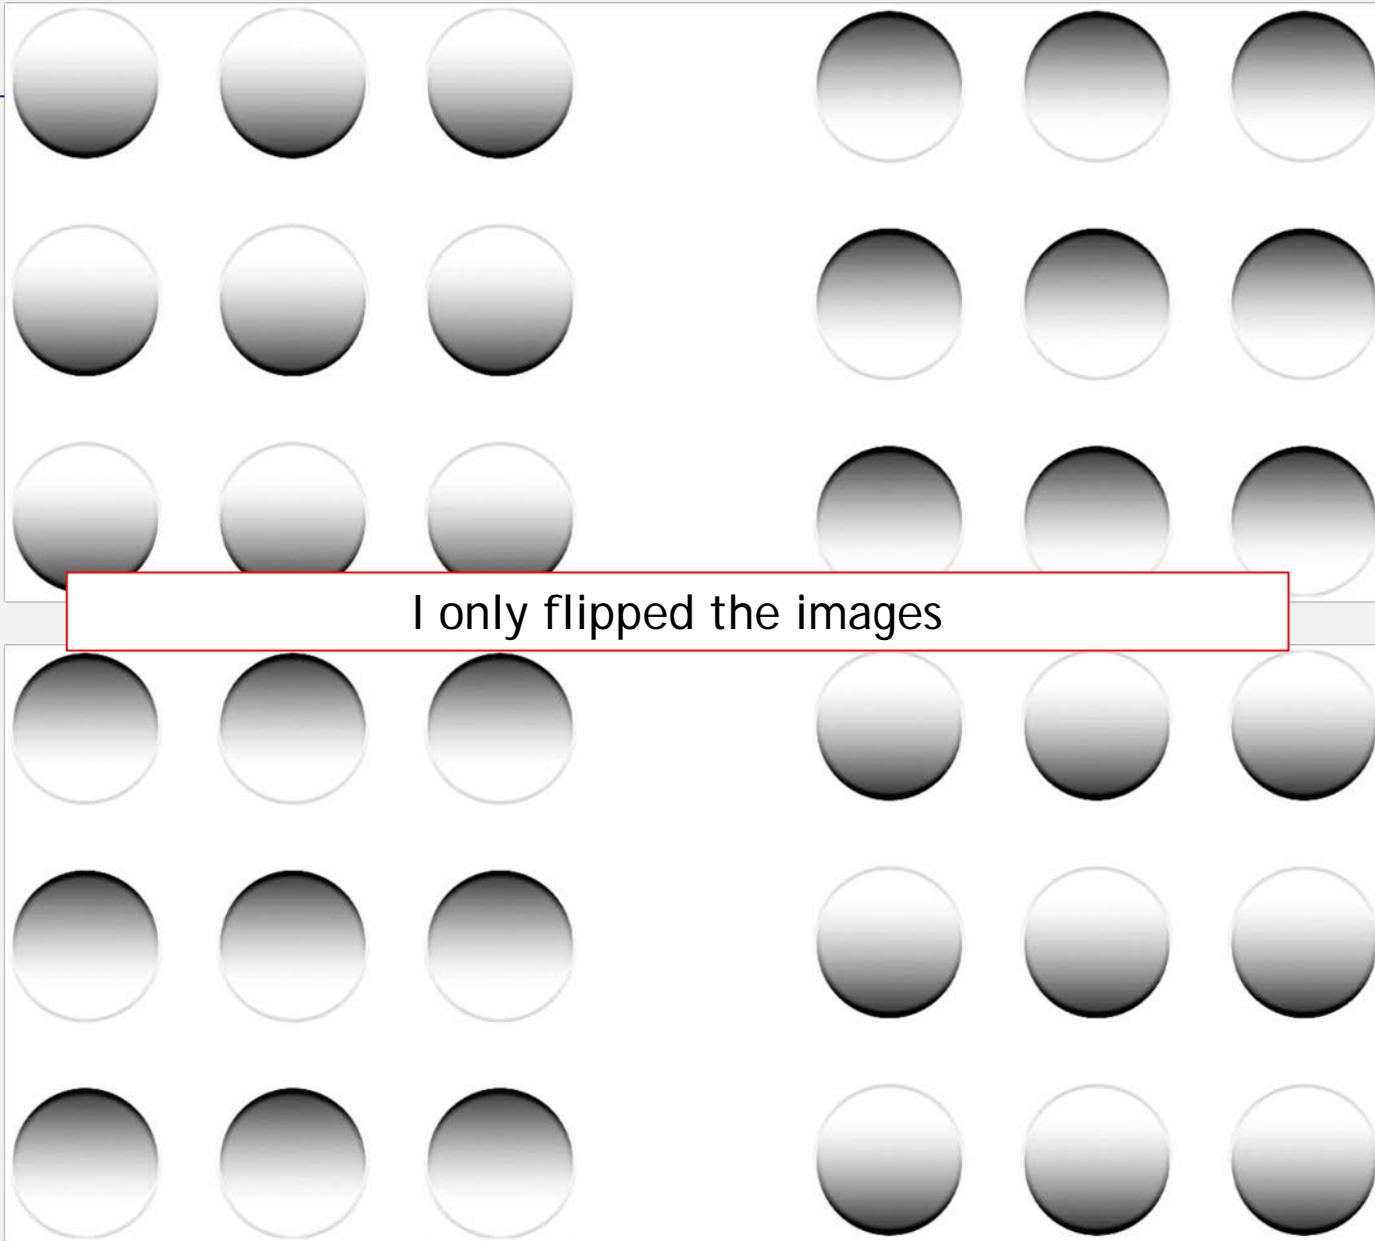

But often vision and brain work together to cheat us

E ora?

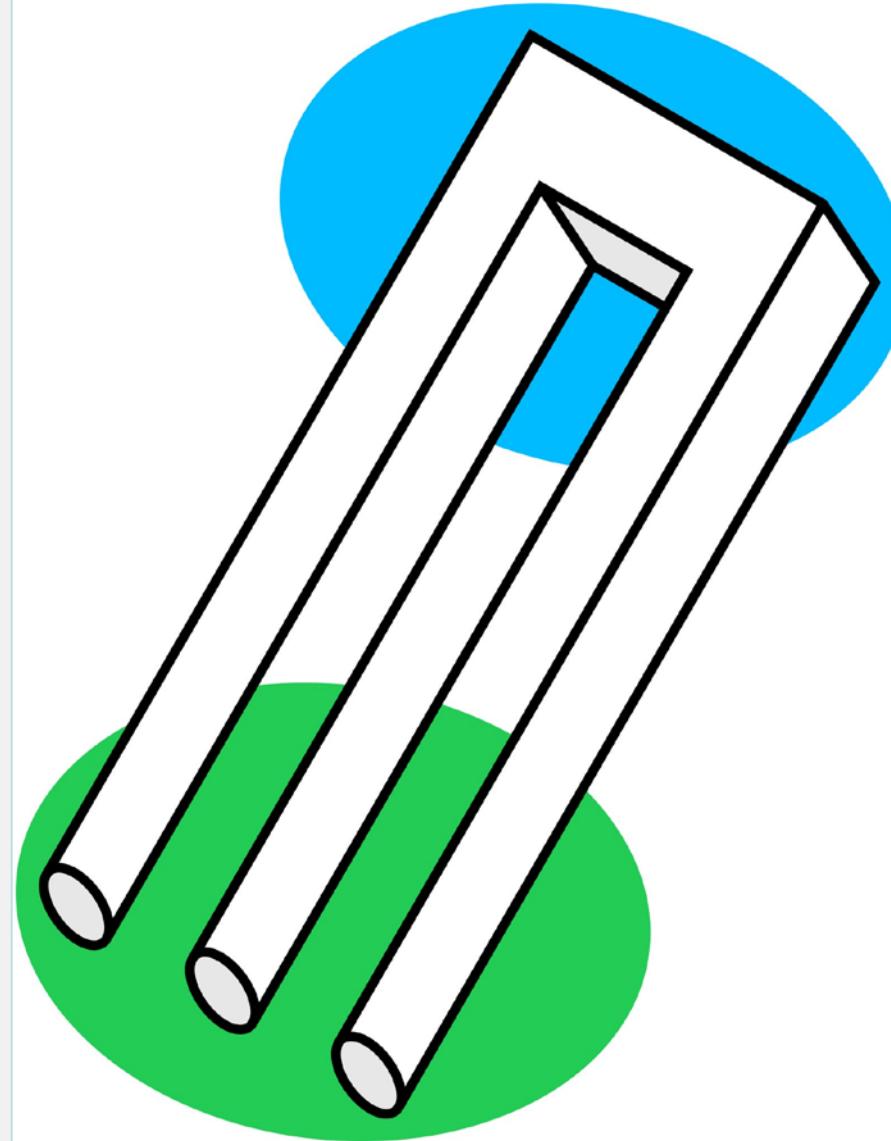

Our brain recalls from memory that, when a 3D object is illuminated, it is shaded.

When the brain does not identify the source of light, it thinks that it comes from the outside, from the sky, from the top of the paper (slide)

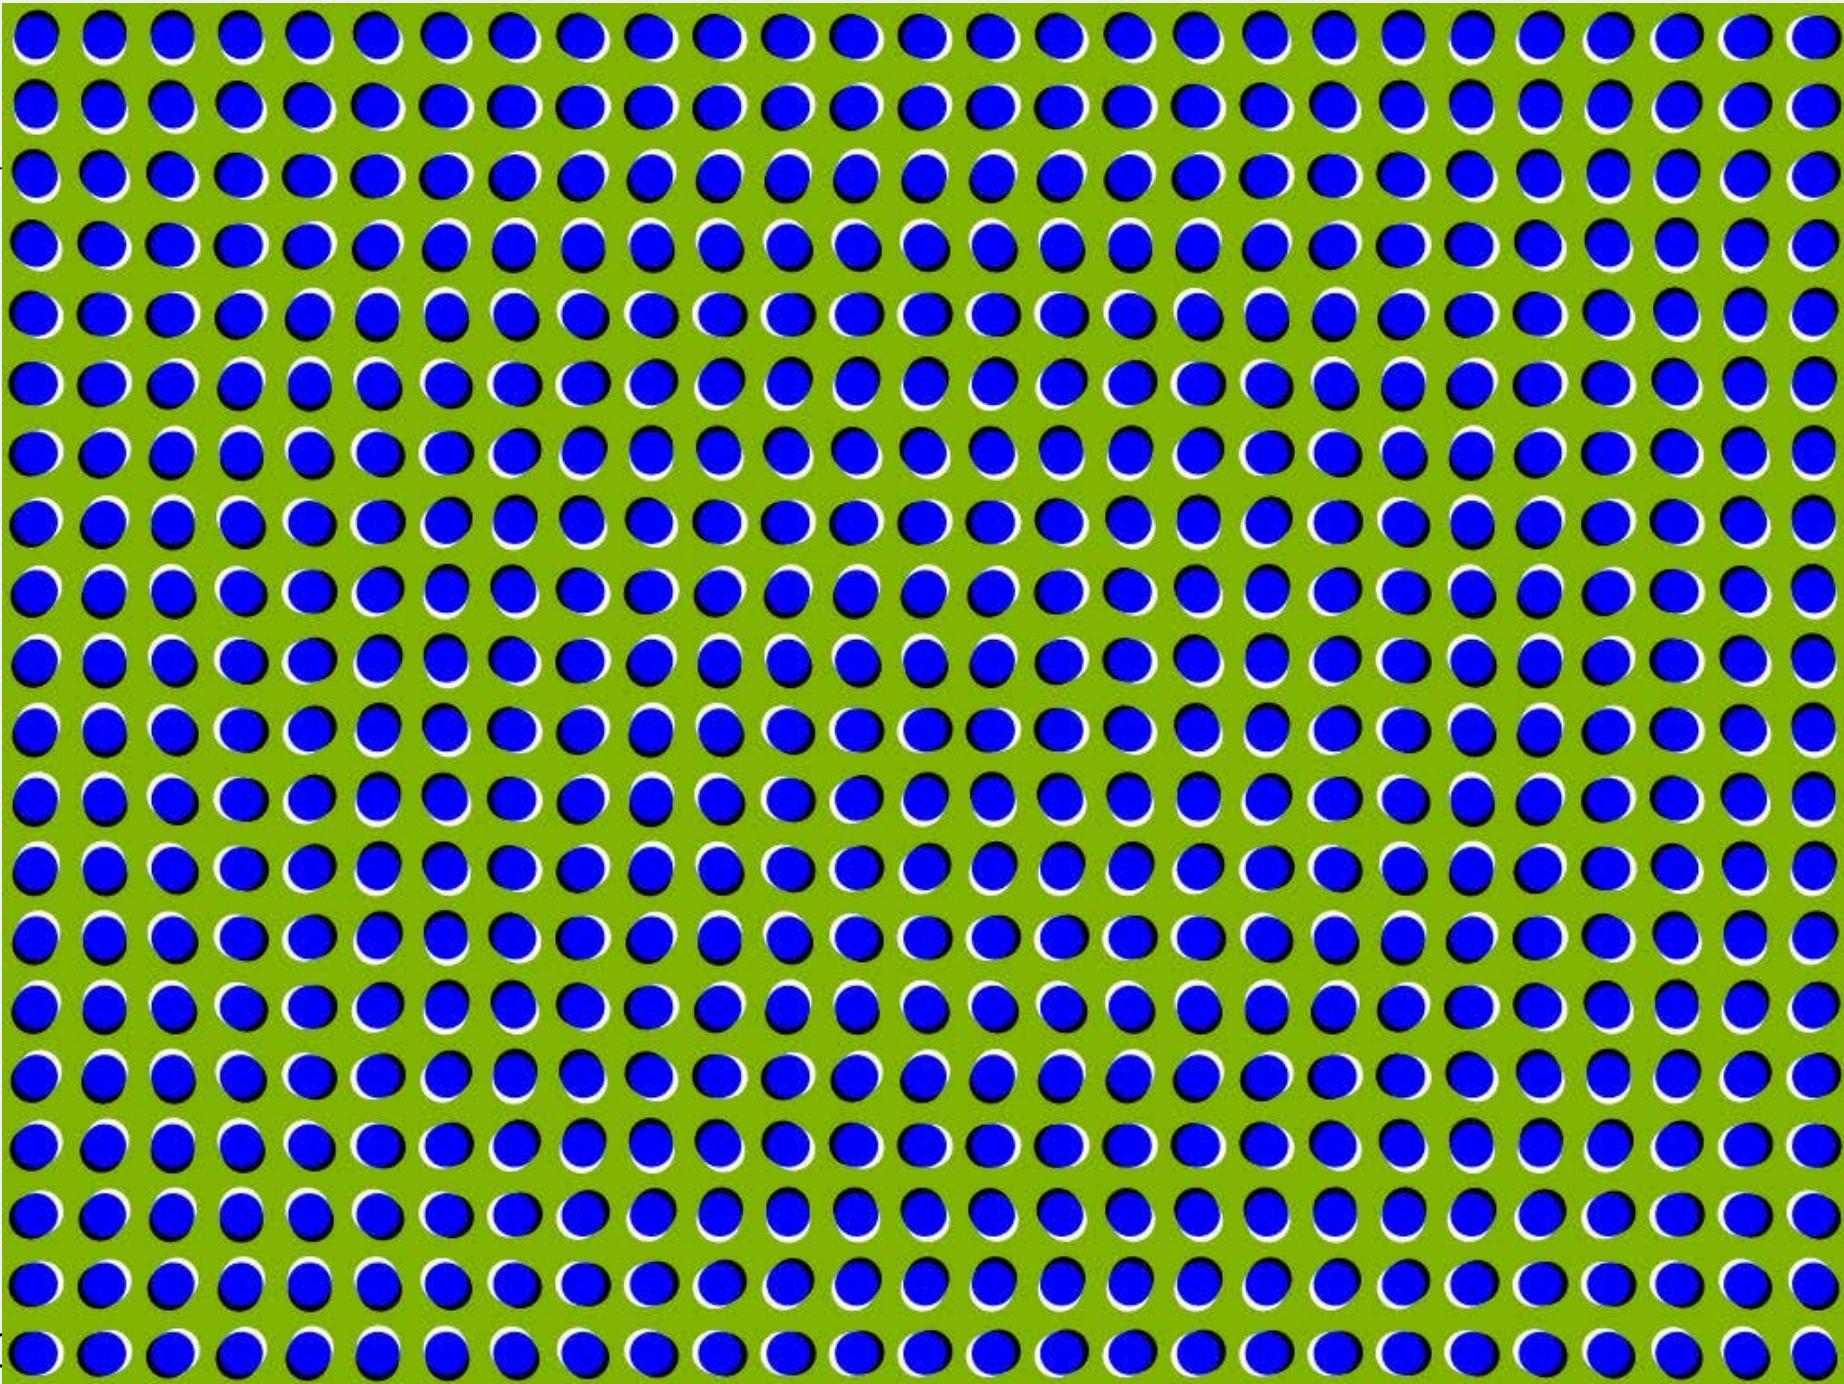

[In the past light came from the sun. That's why we think it comes from the top.

In the future experience may change.]

Impossible fork

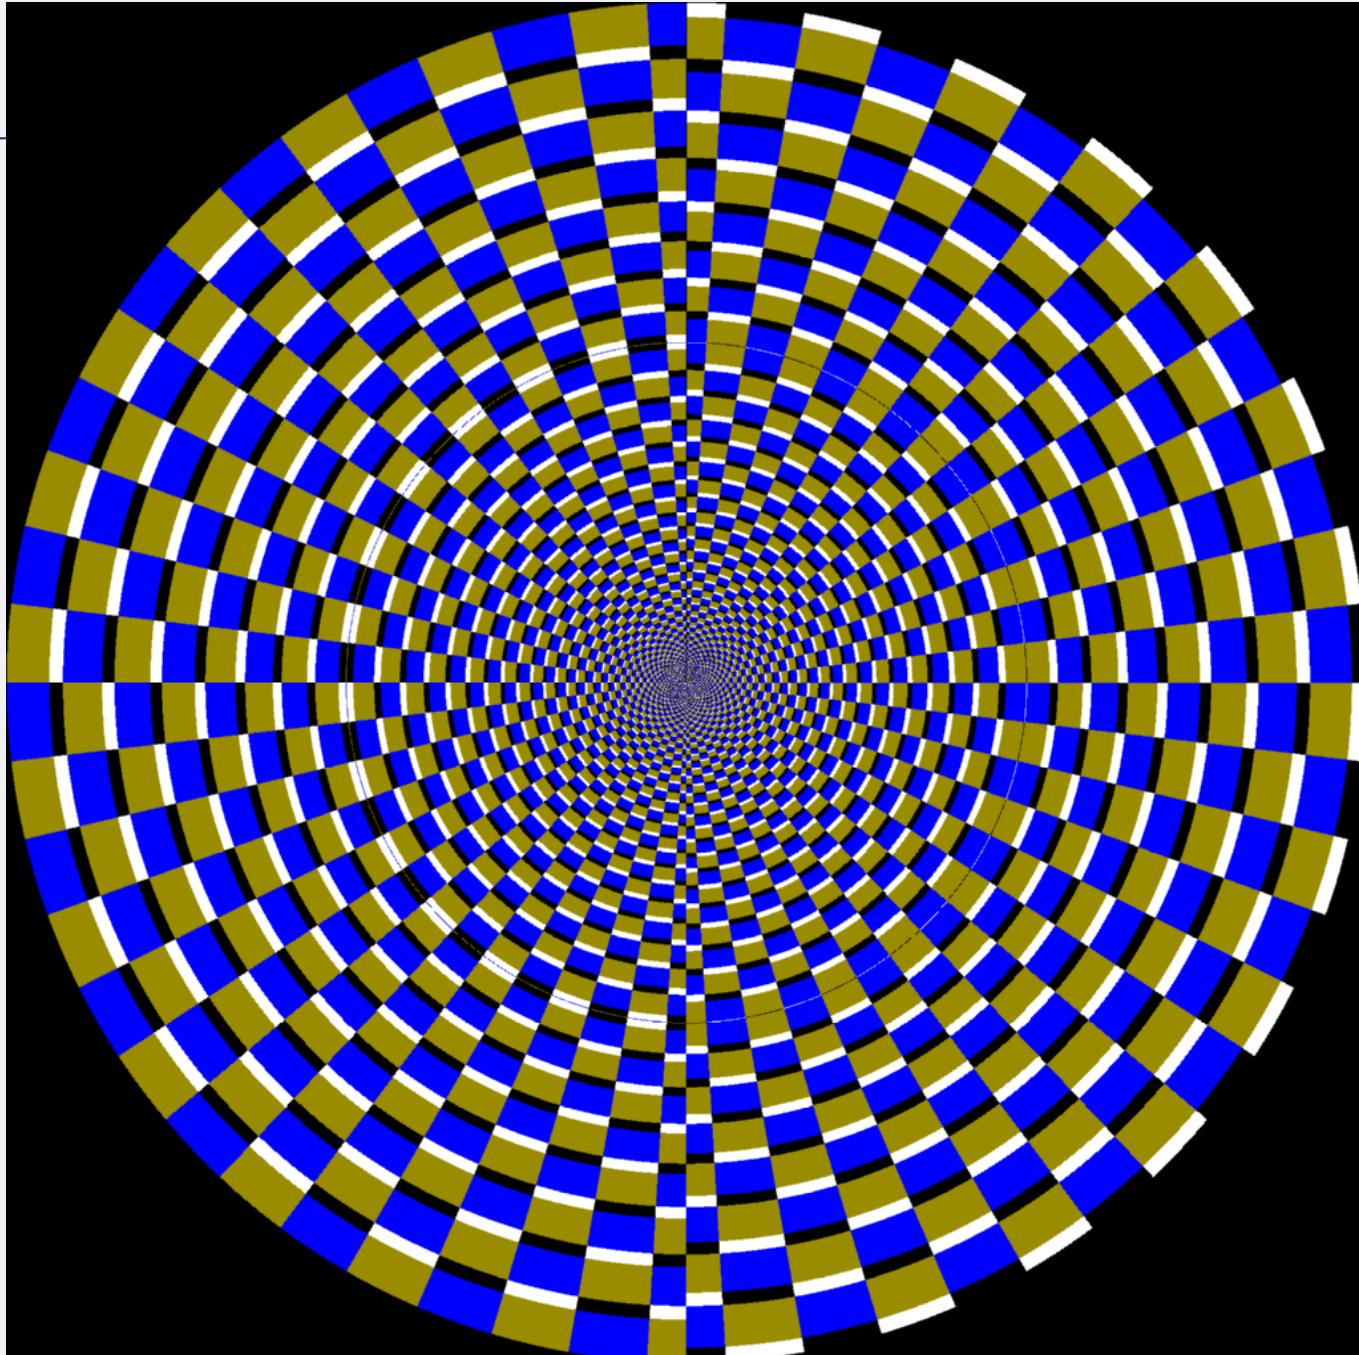

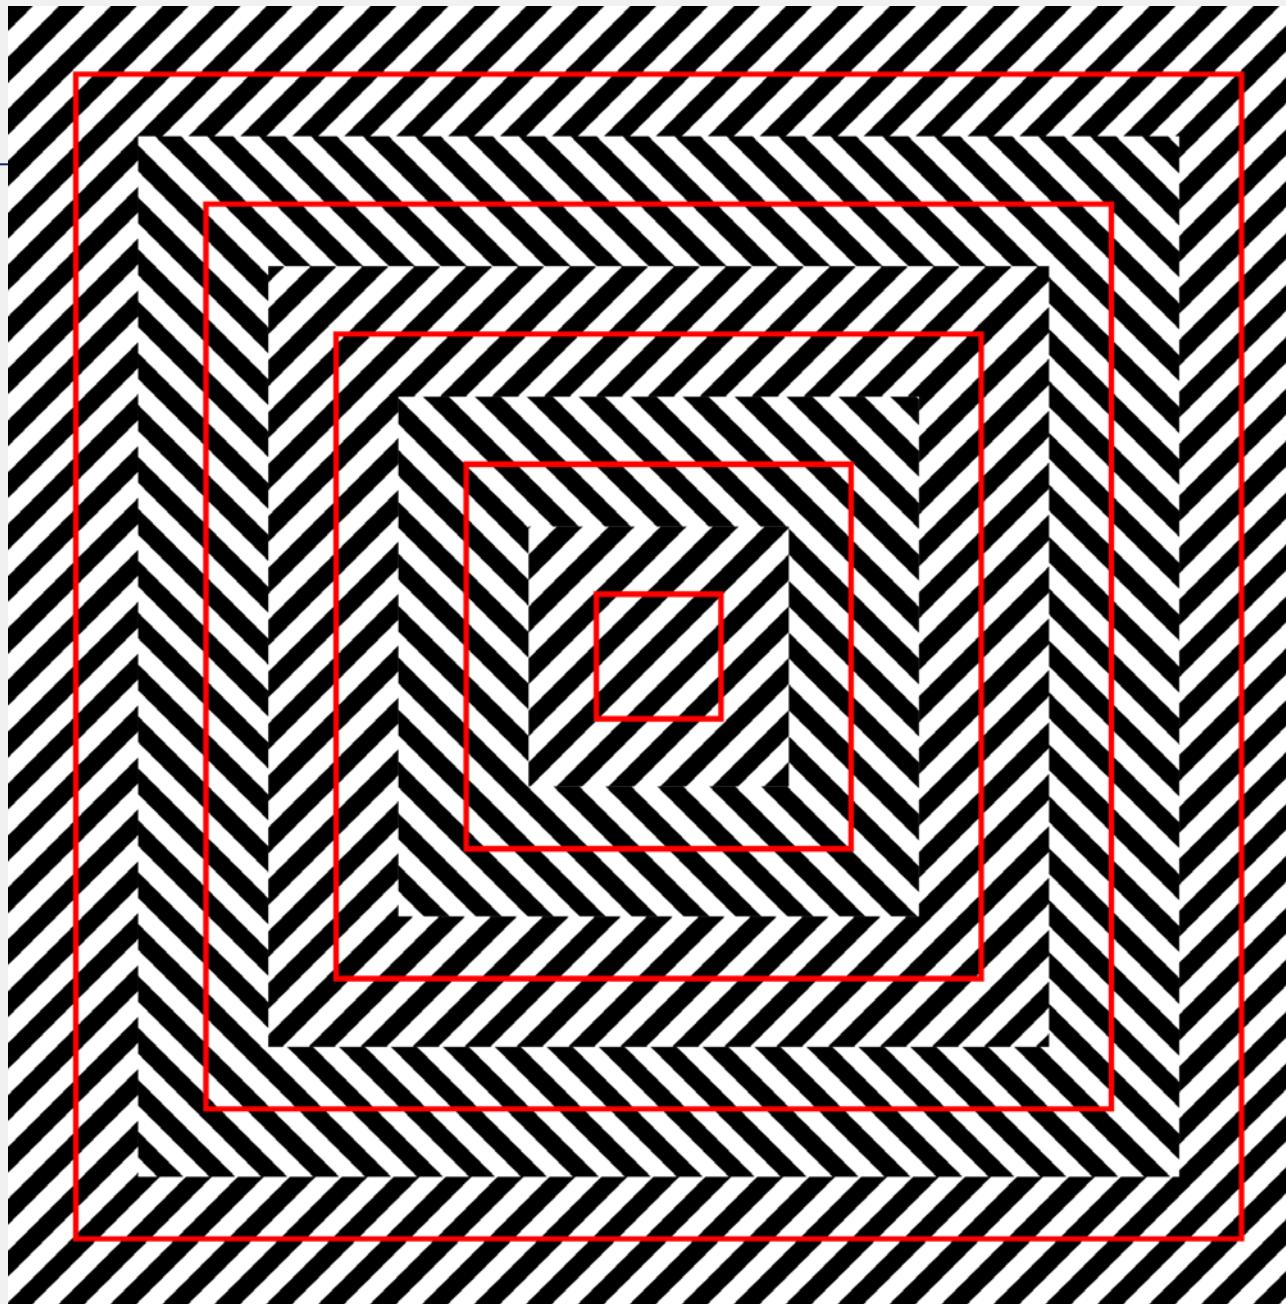

Peripheral drift illusion:

motion illusion in images with asymmetric static patterns.

Two theories. It is due to:

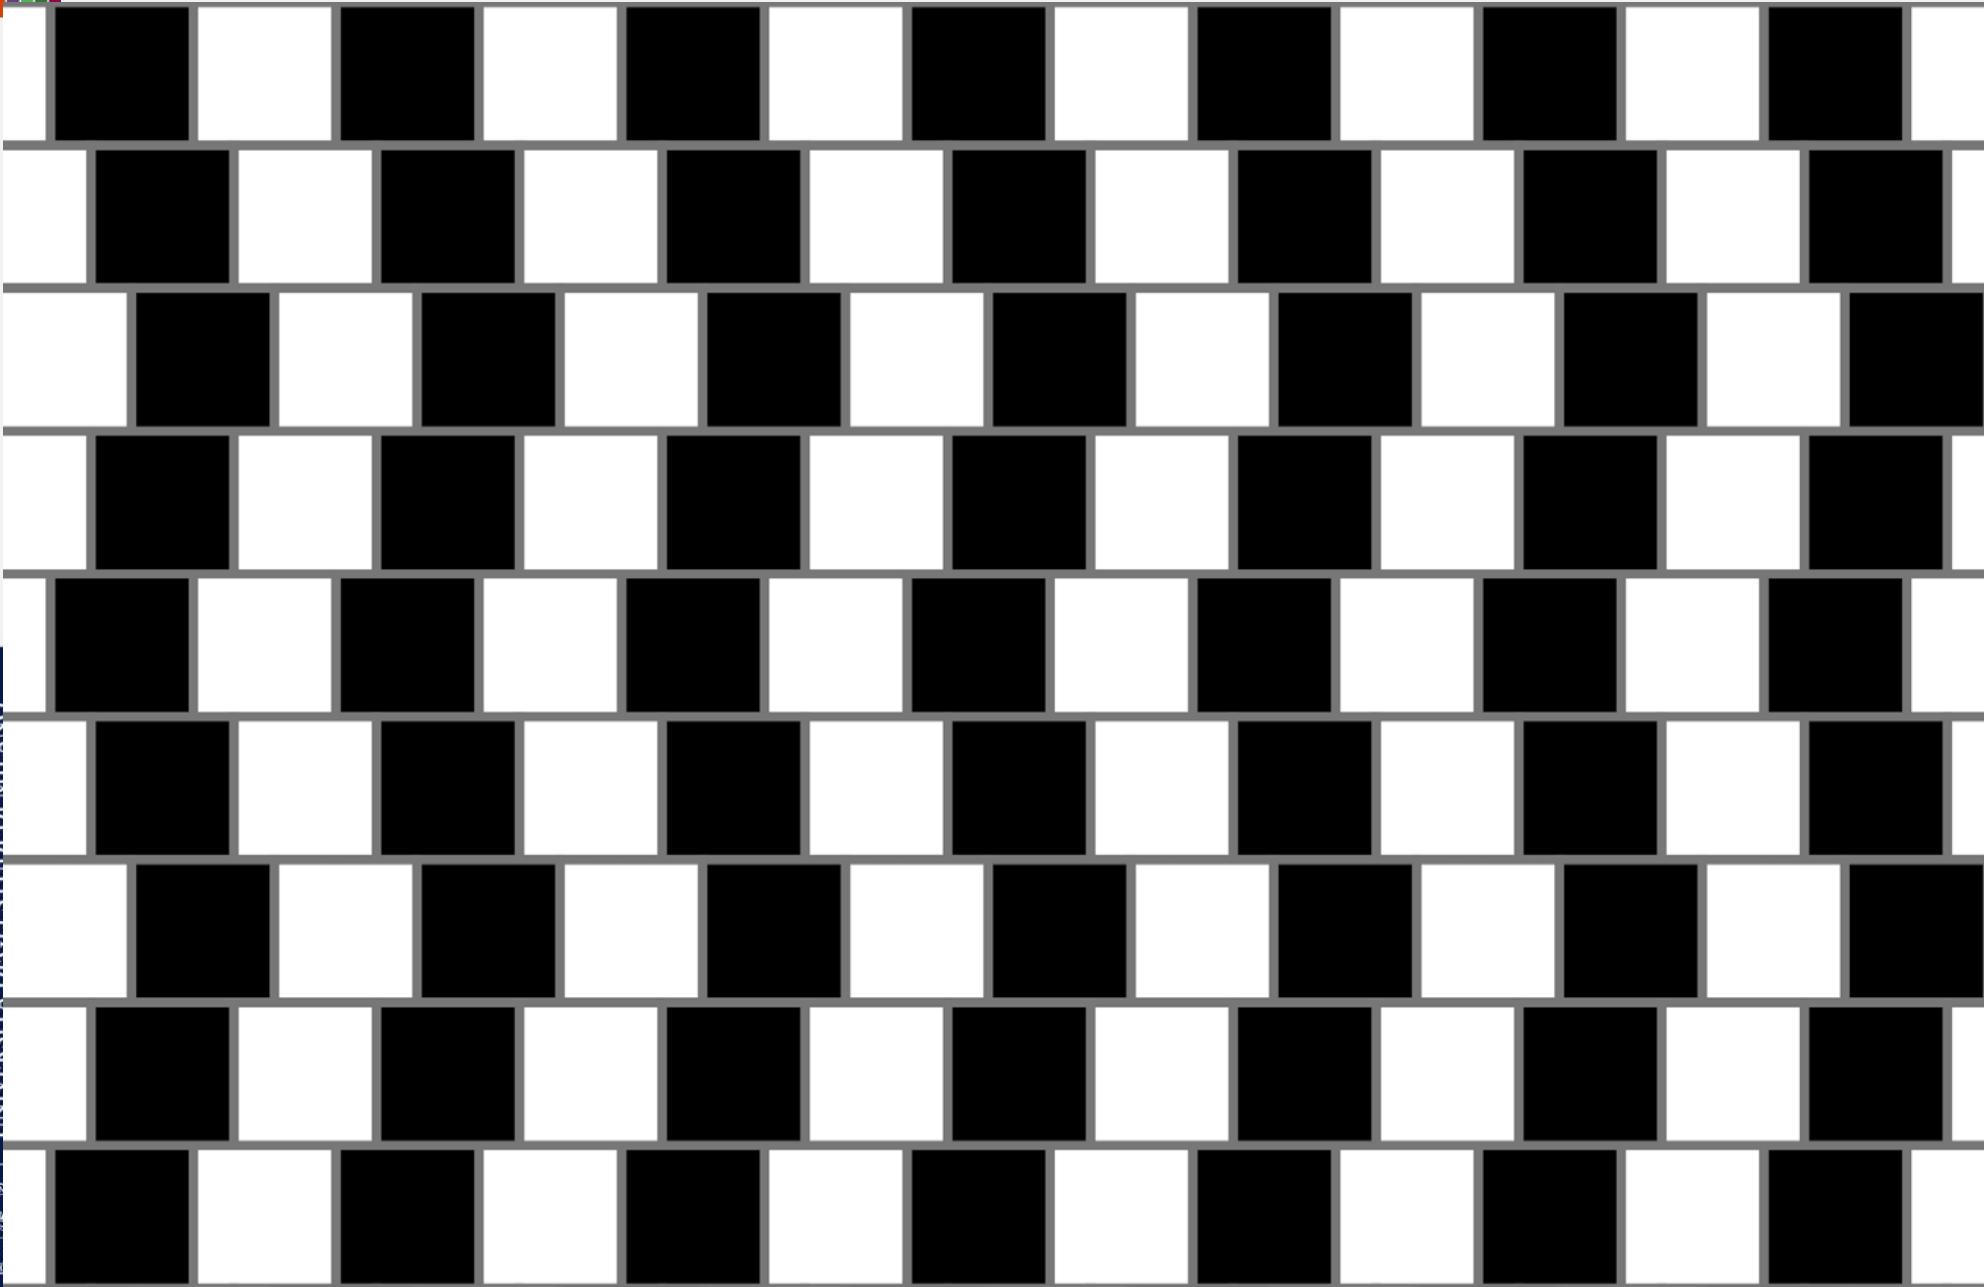

- 1) Fast saccadic movements due to the high level of details
- 2) Fast contrast change which characterizes moving object (experiments showed that they create a neural activity similar to that of people observing moving objects).

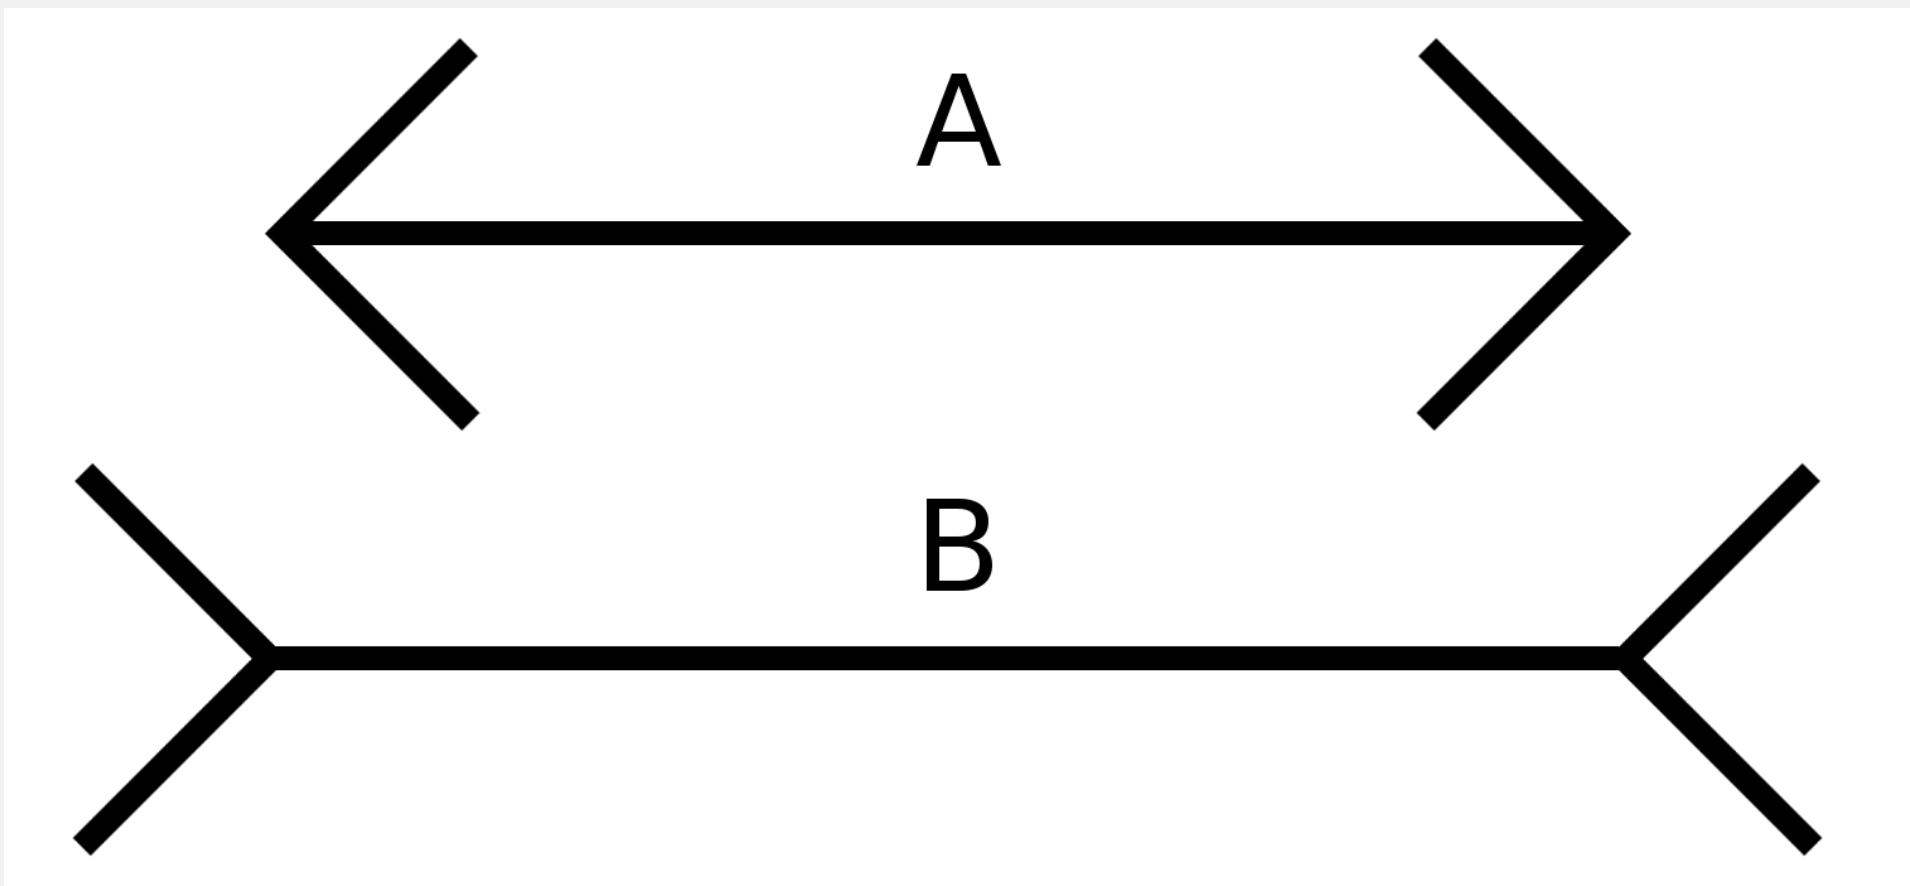

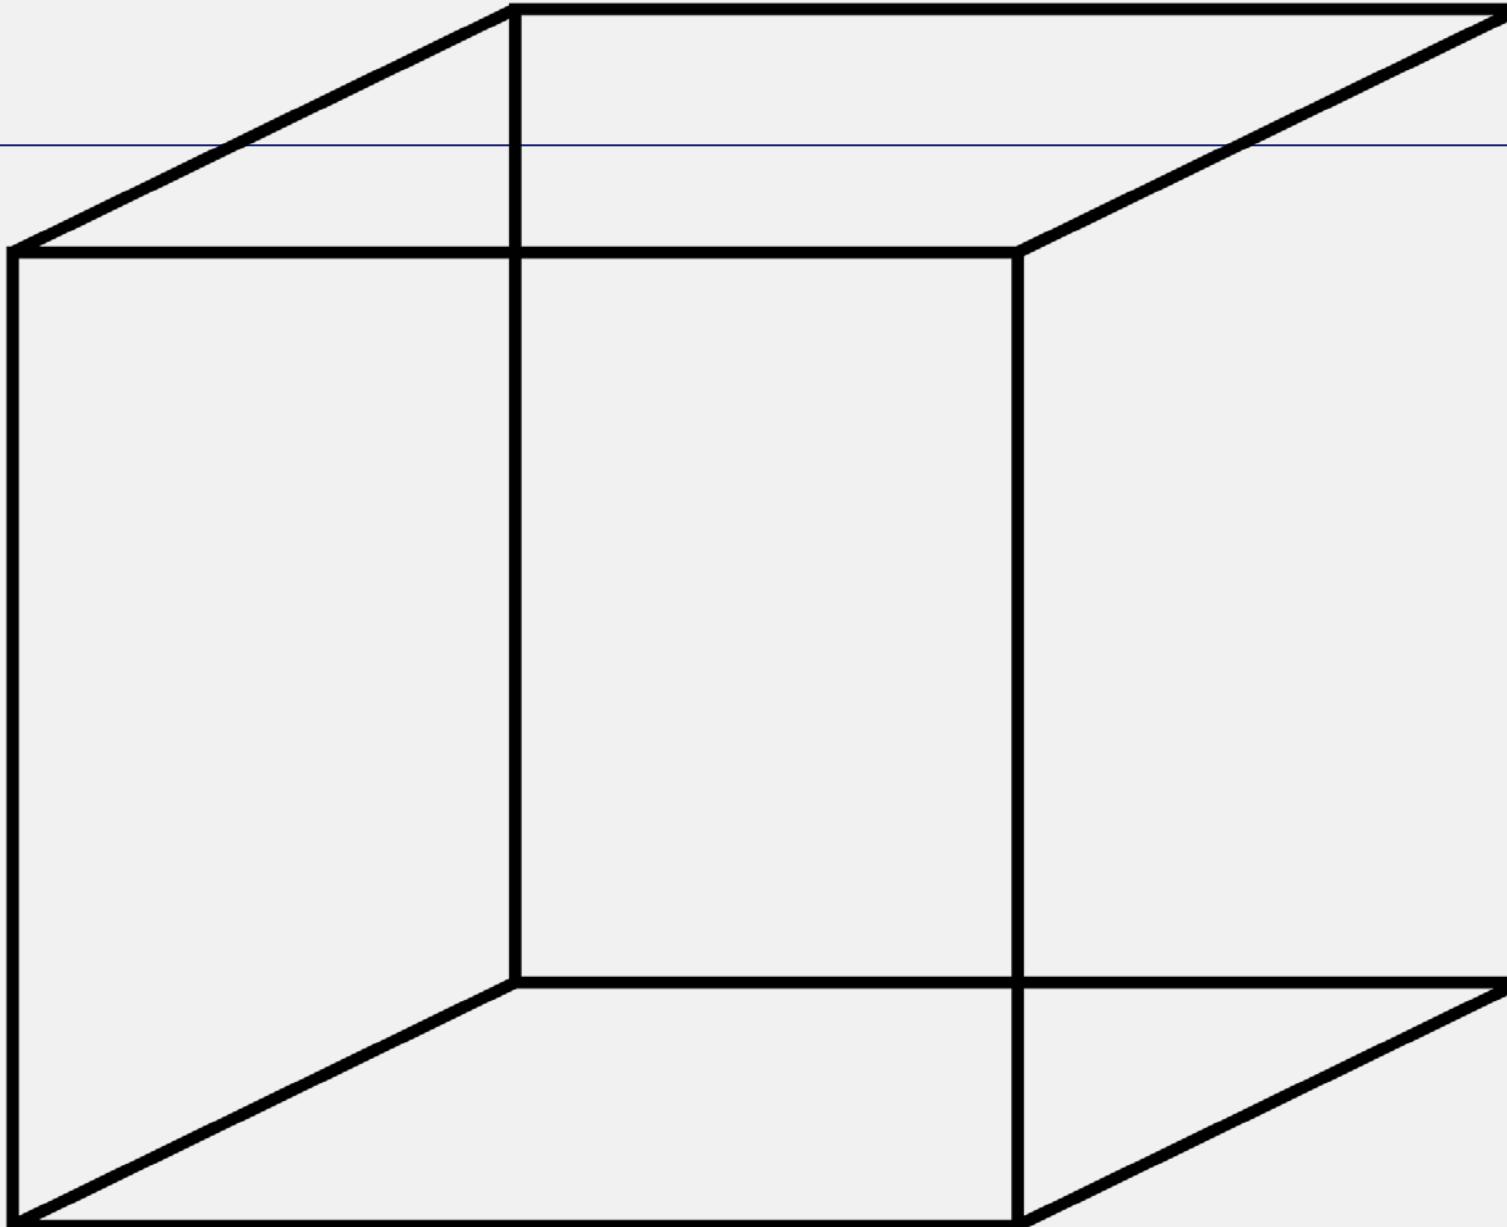

Distorsions:
Squares are
squares?

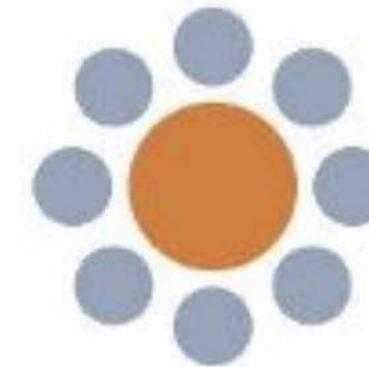

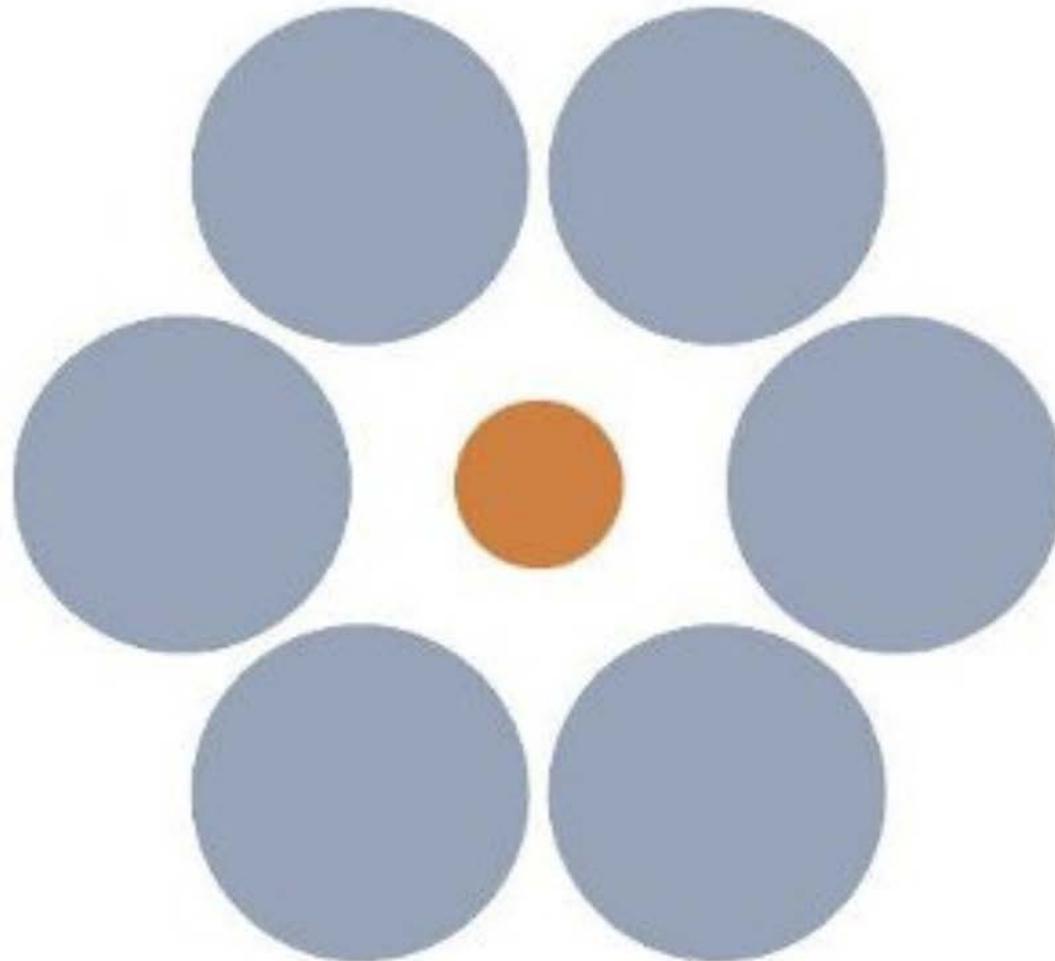

Which is
longer?

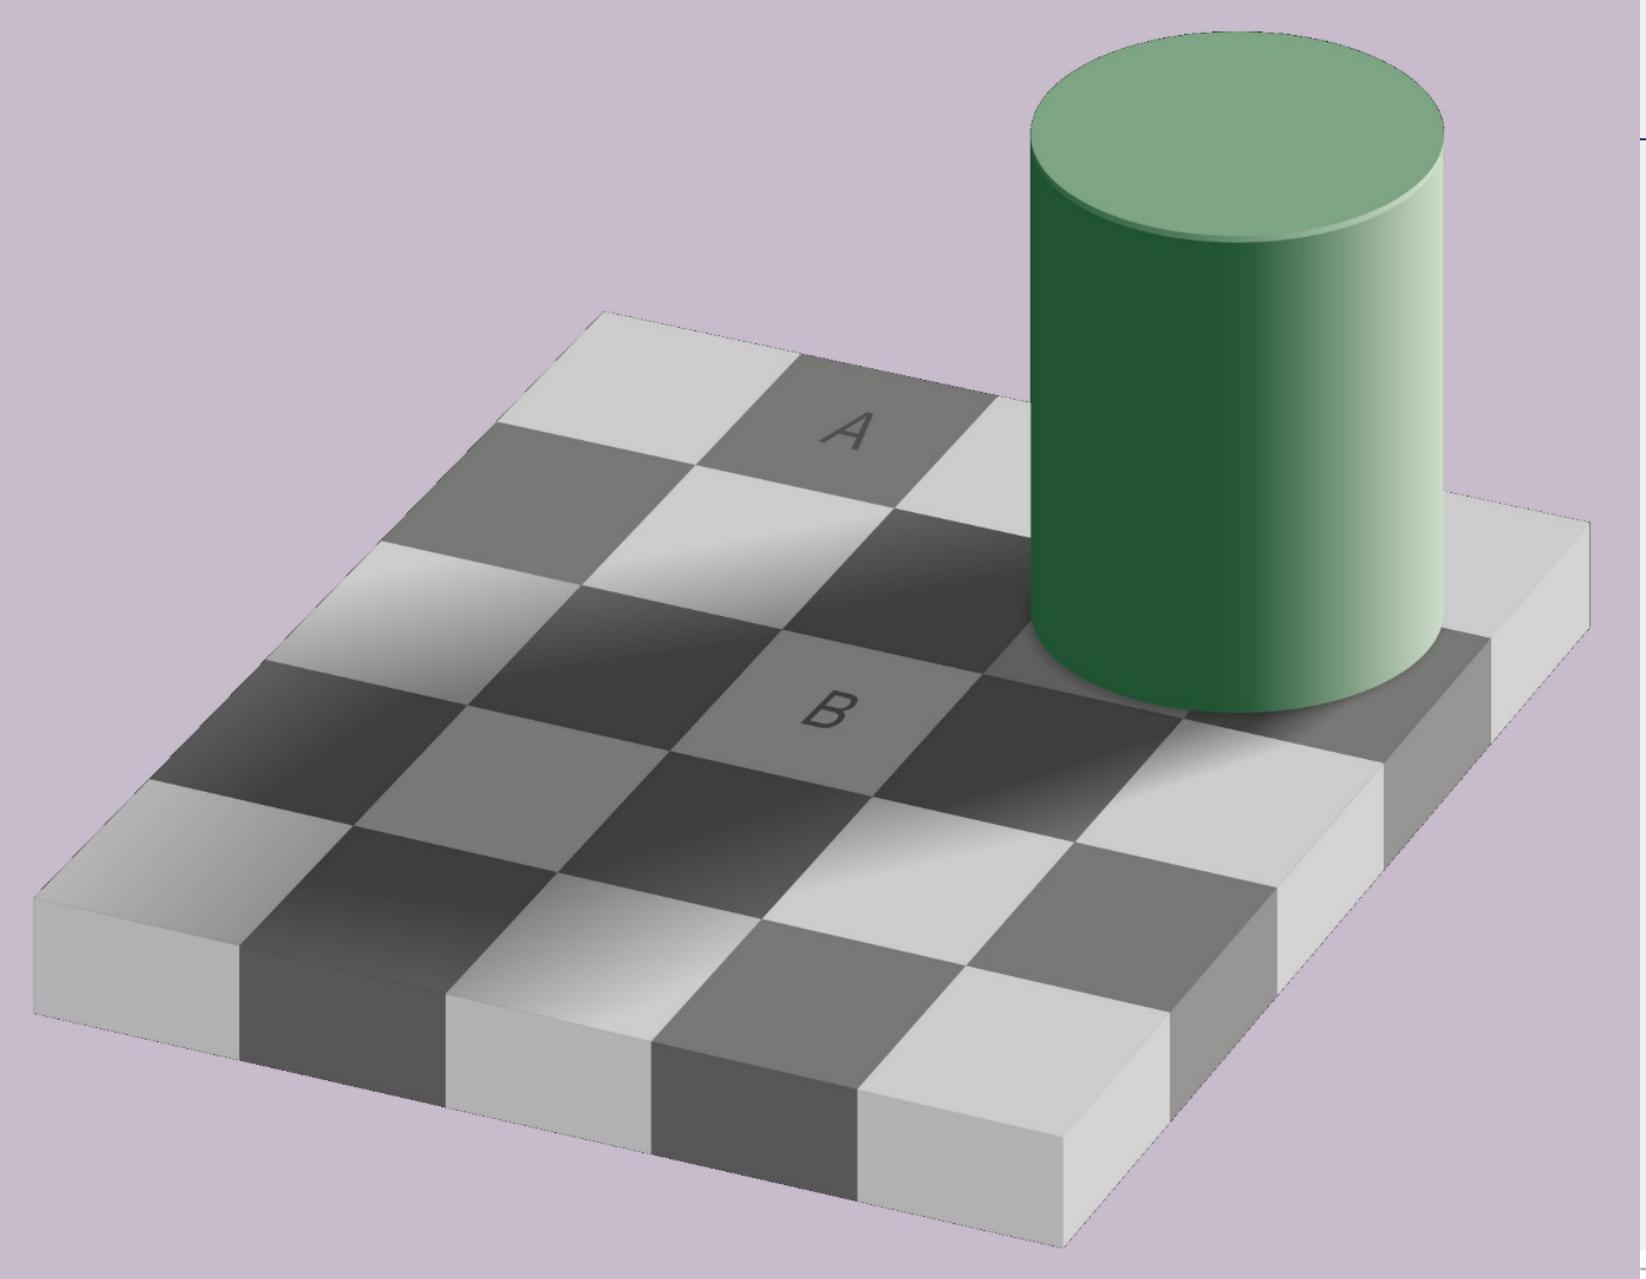

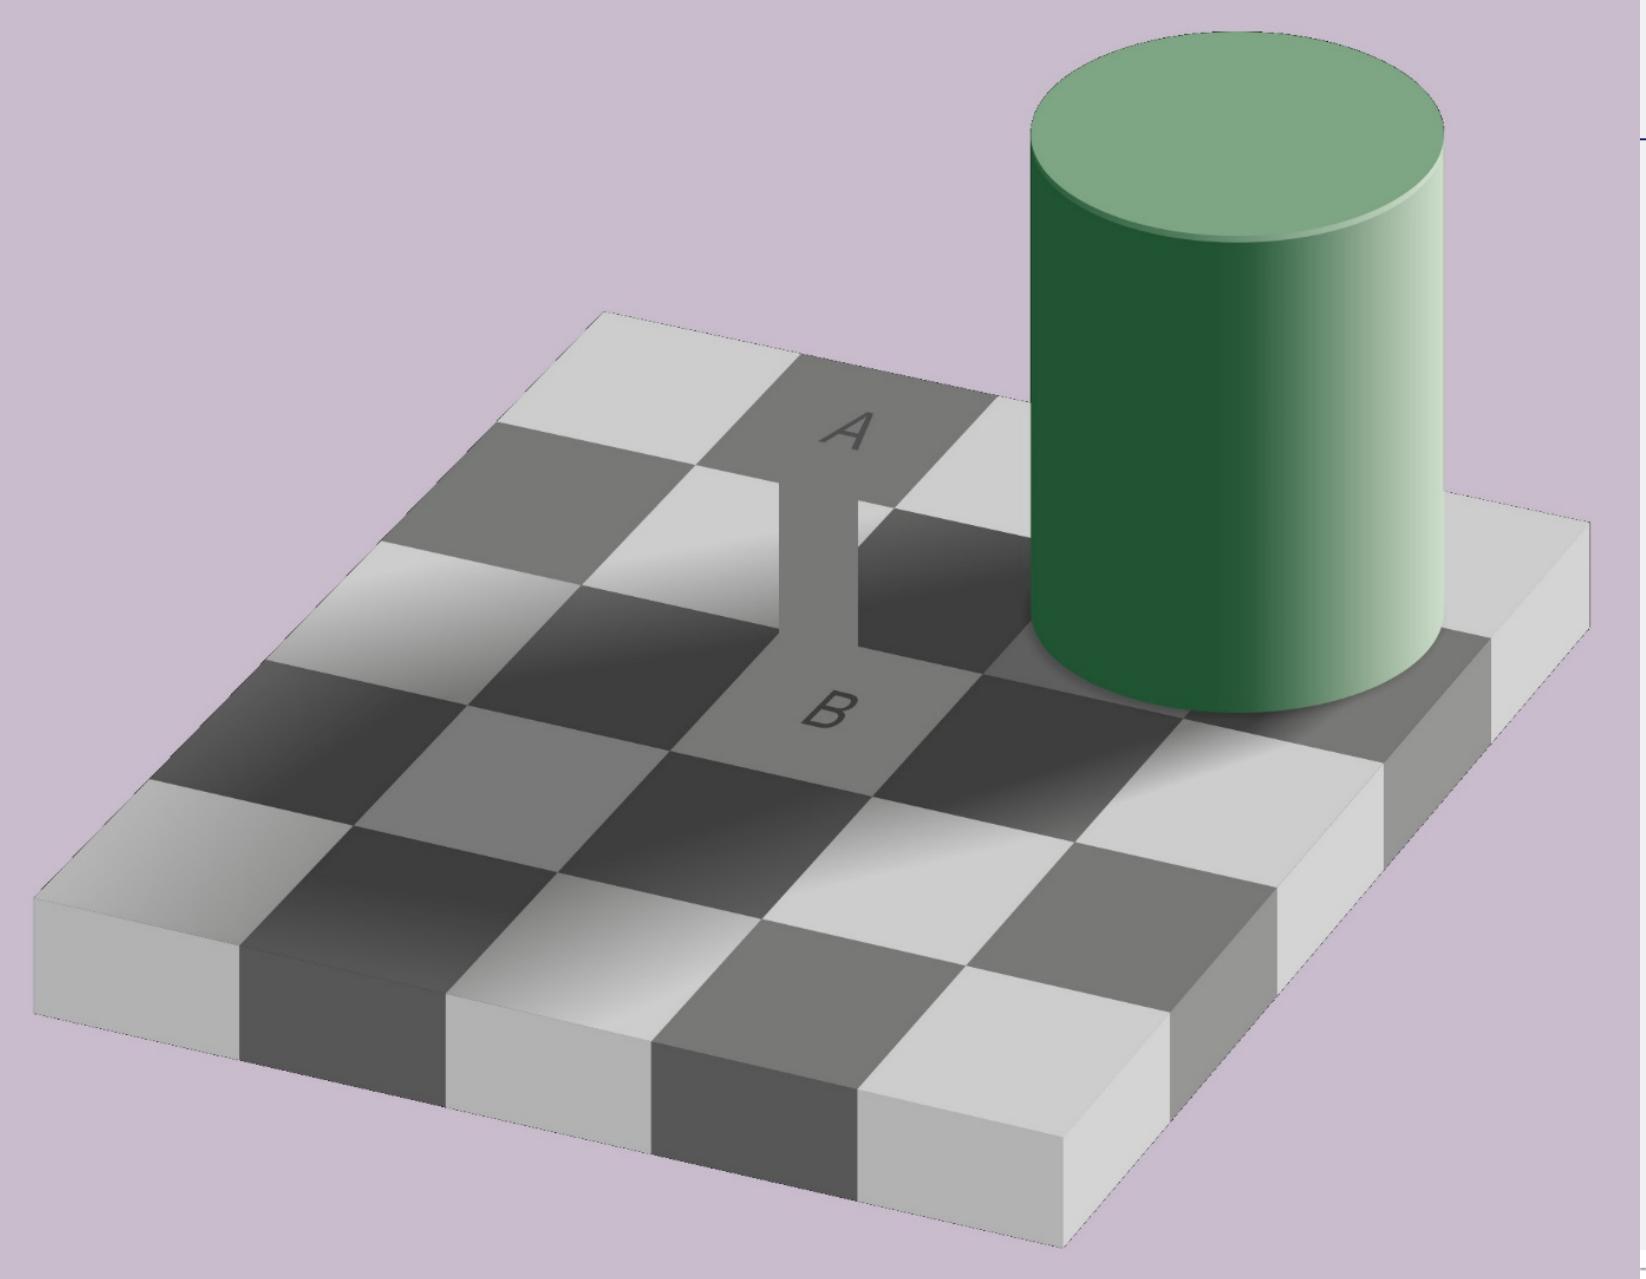

Why you
shouldn't use 3D

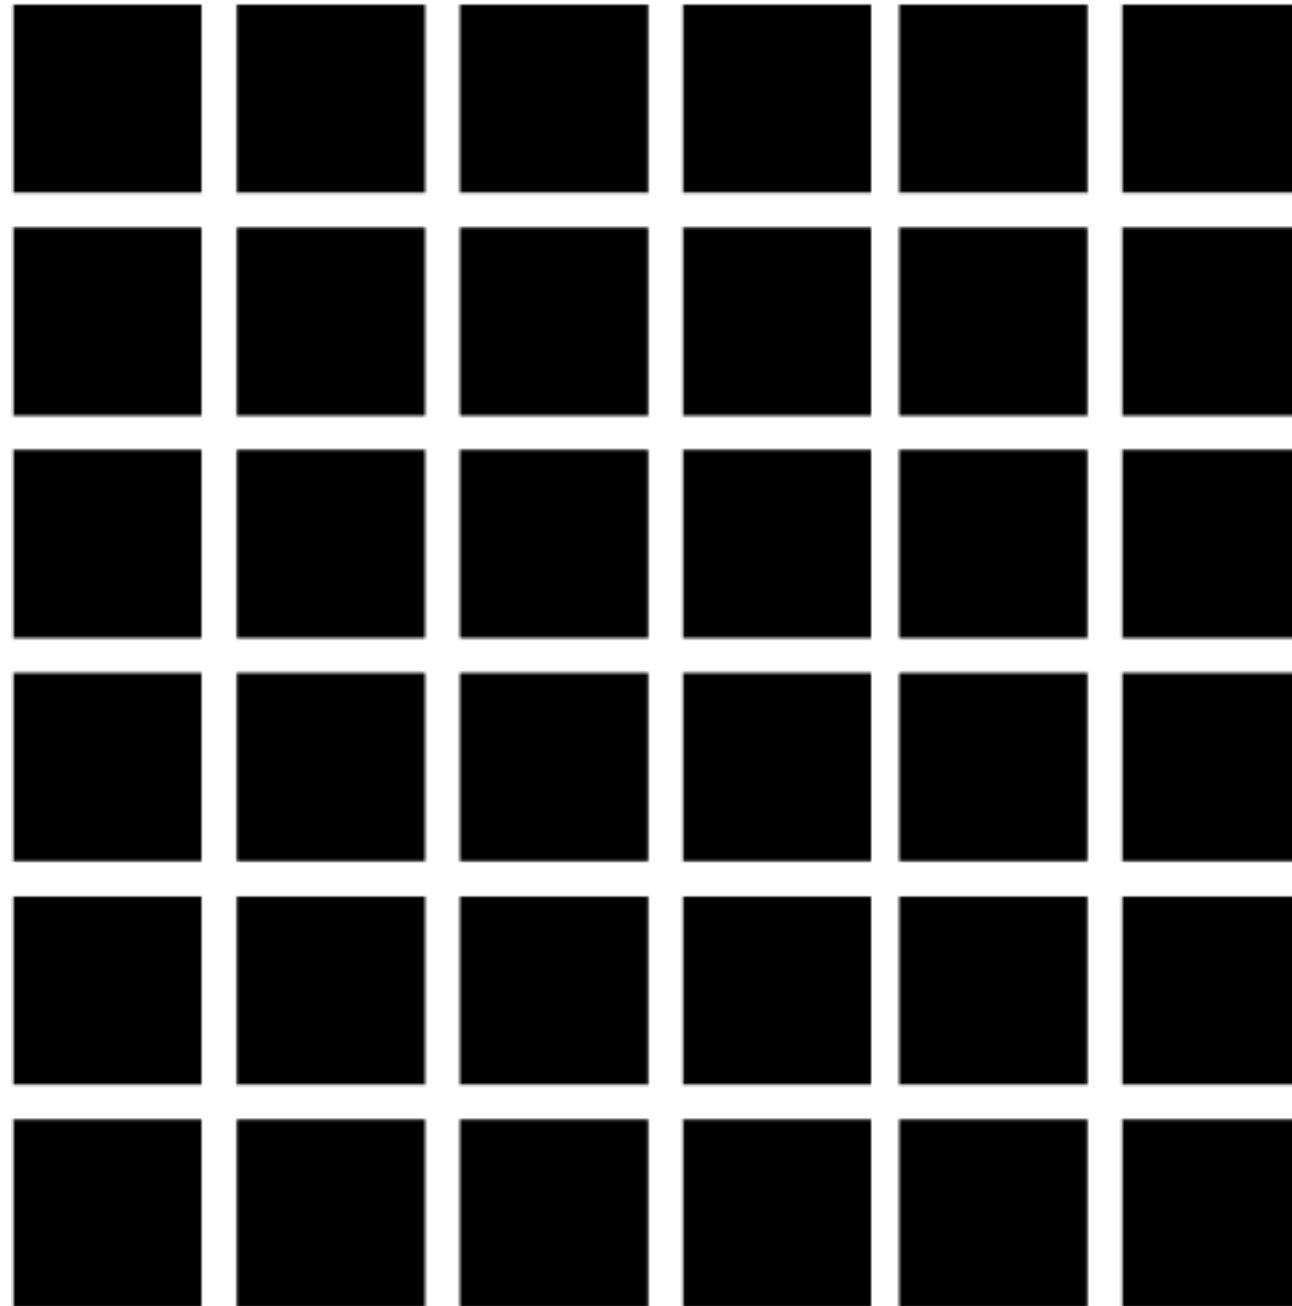

Mind the colors. Which circle is bigger??

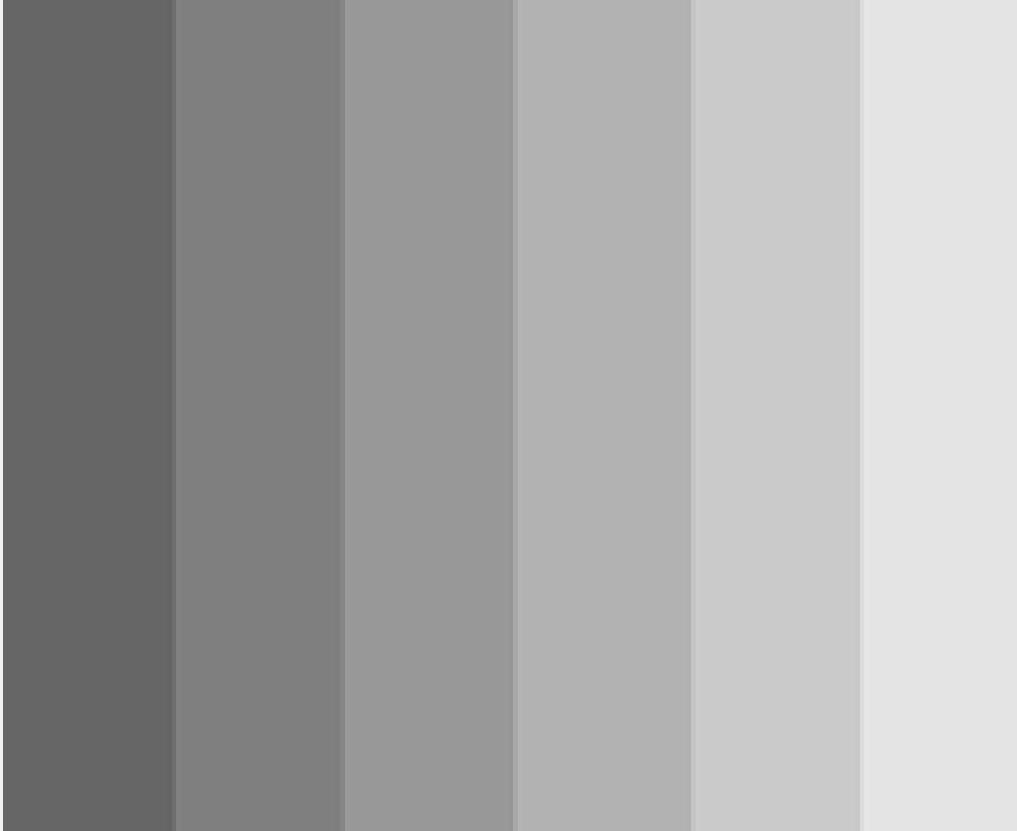

3/30/2020

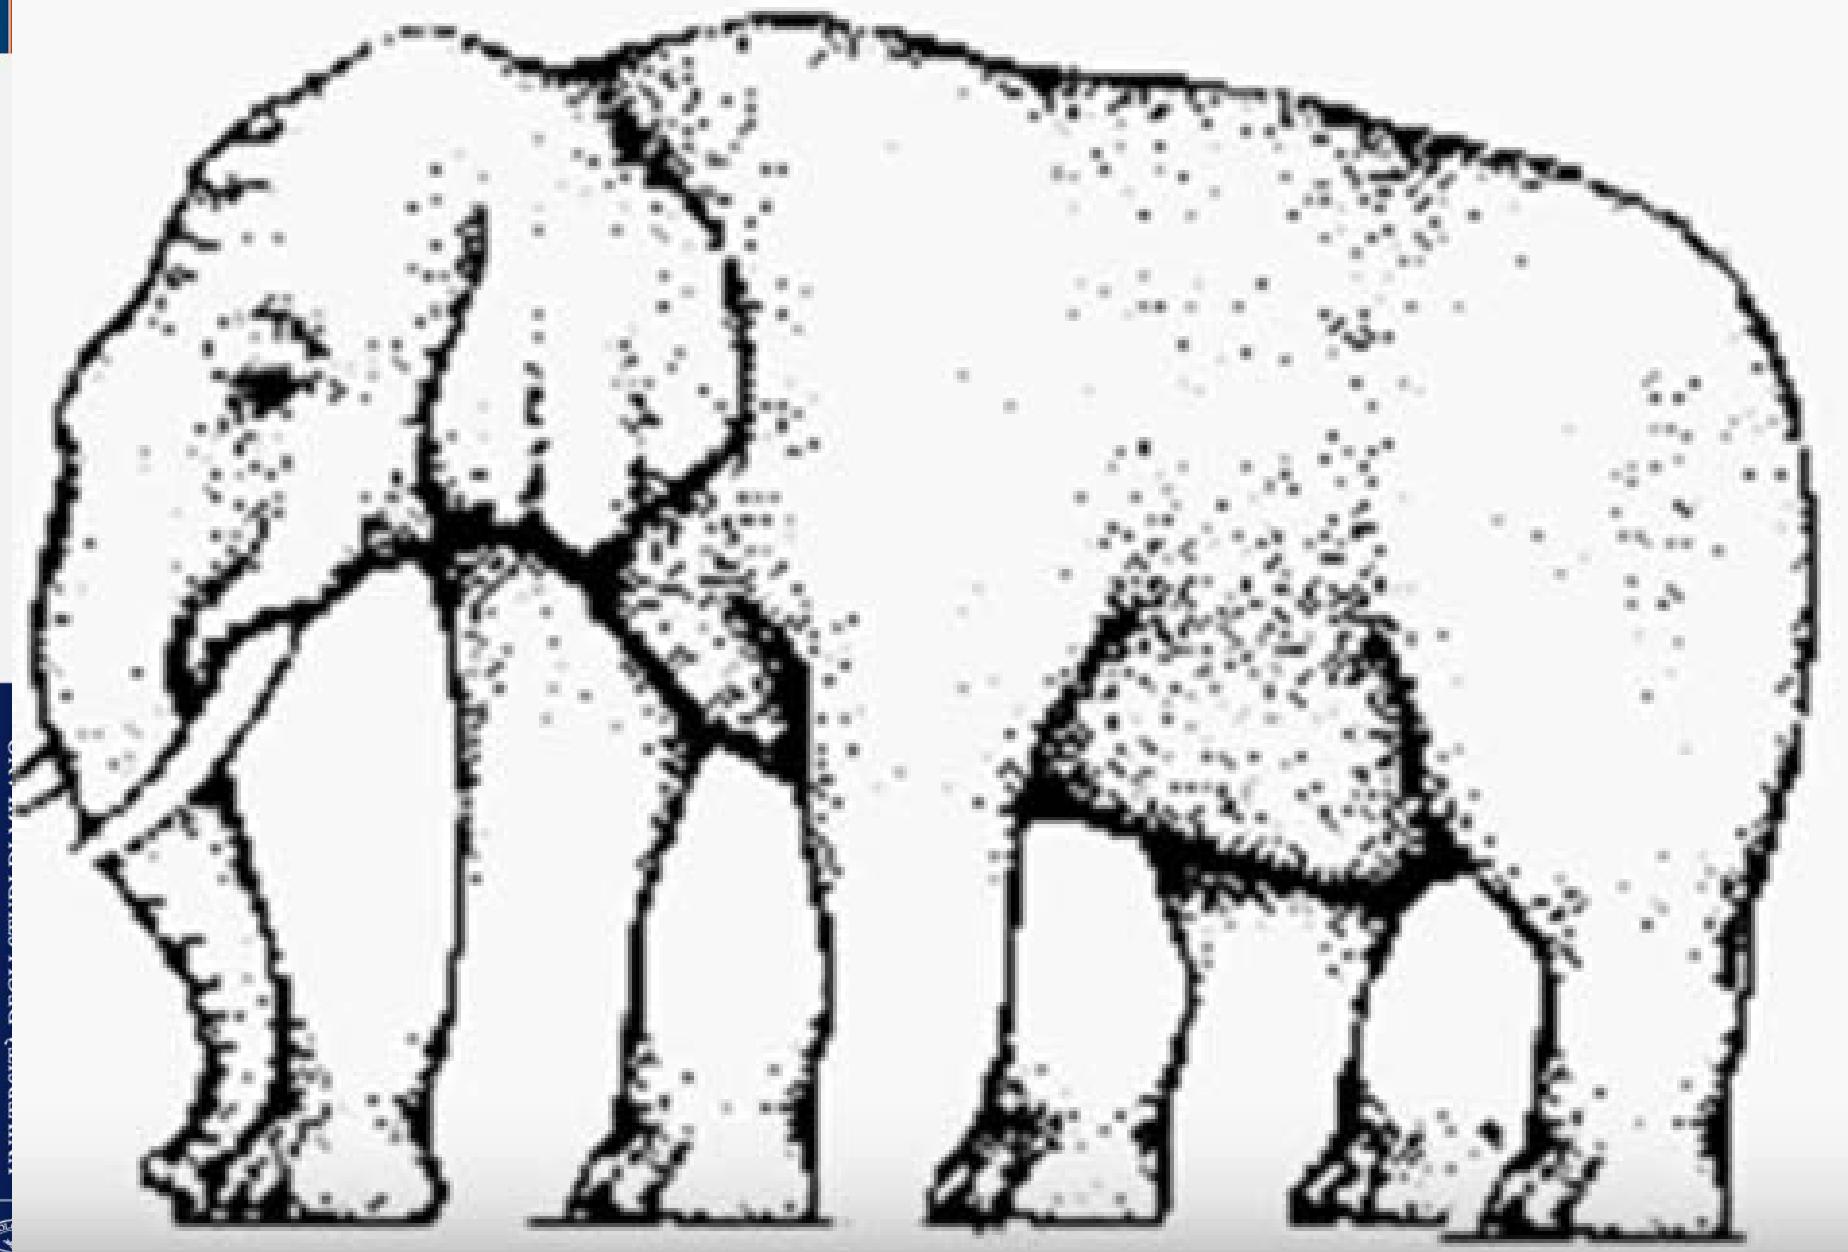

Neural inhibition
(on/off cells)

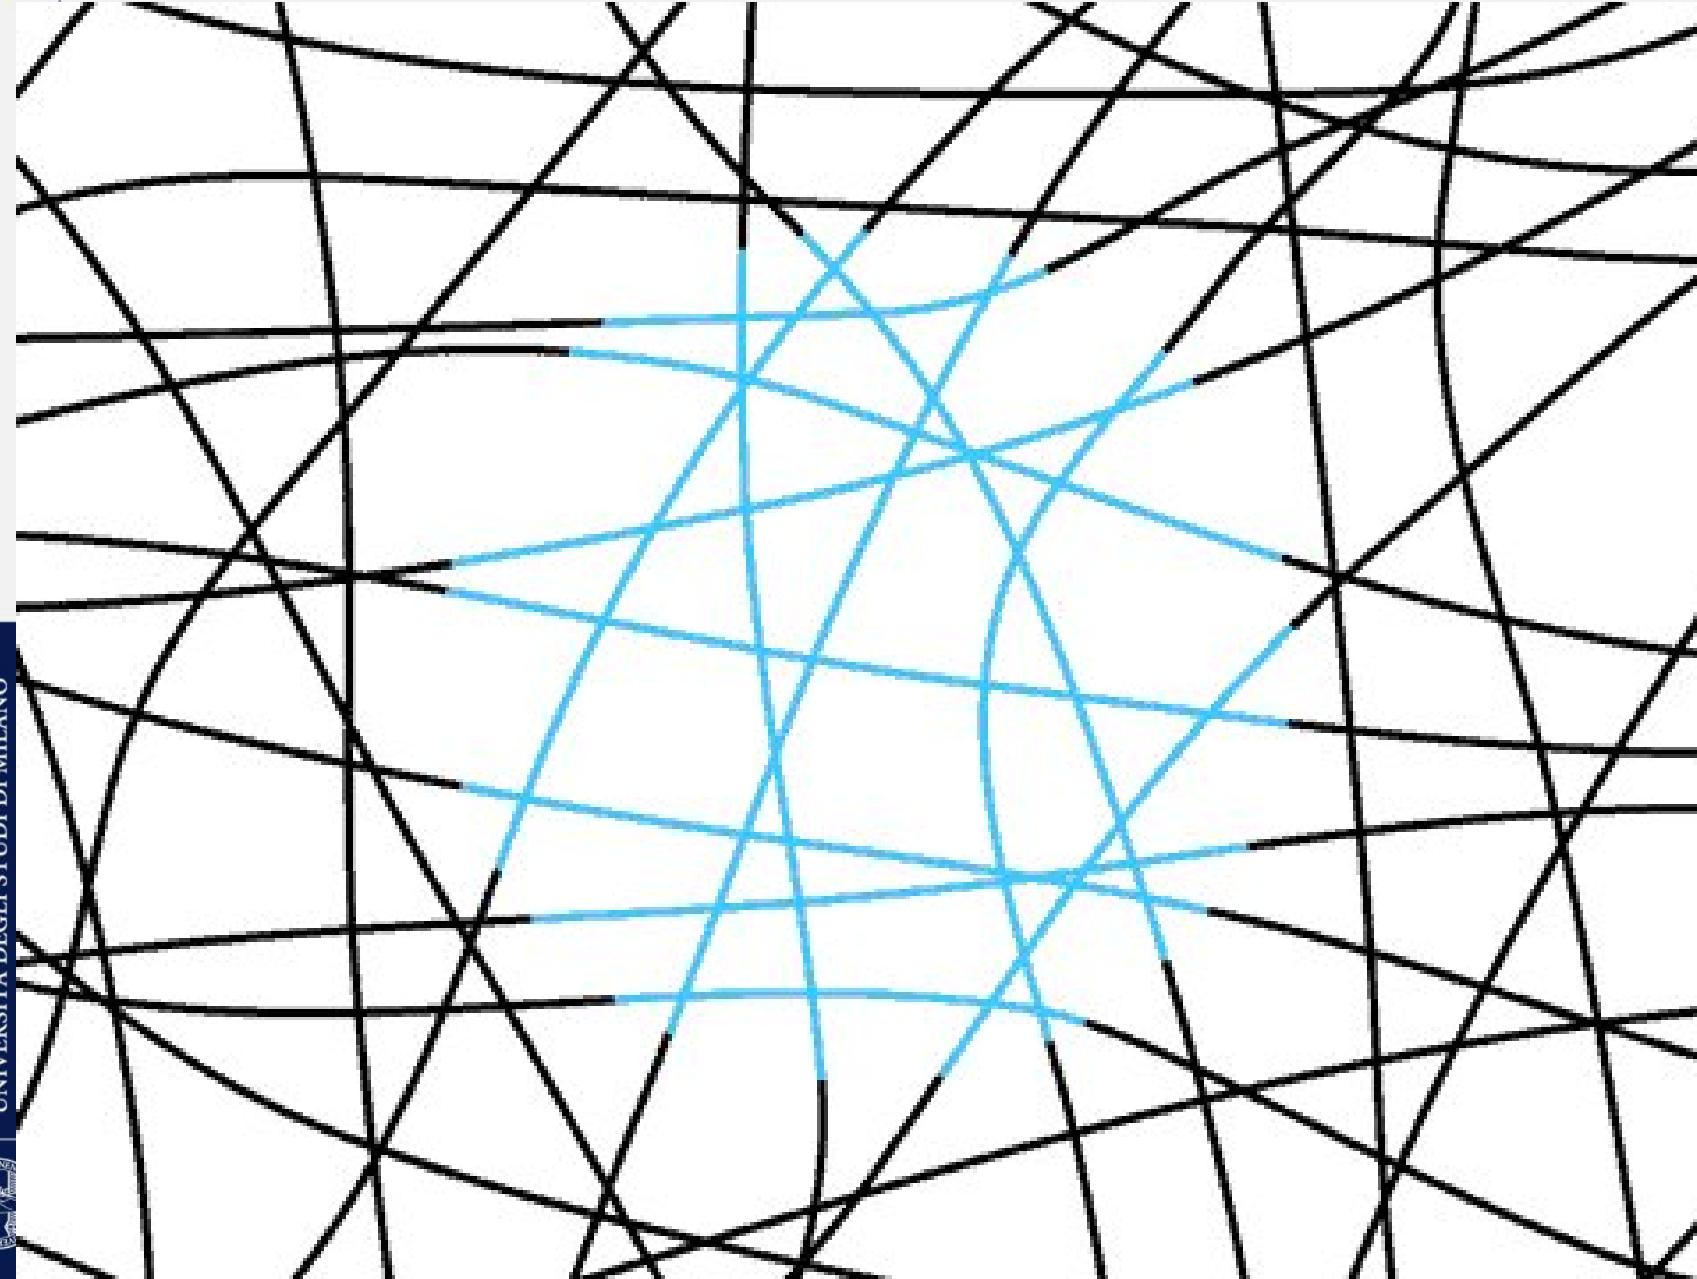

Mach Bands...
Mind bar chart put together

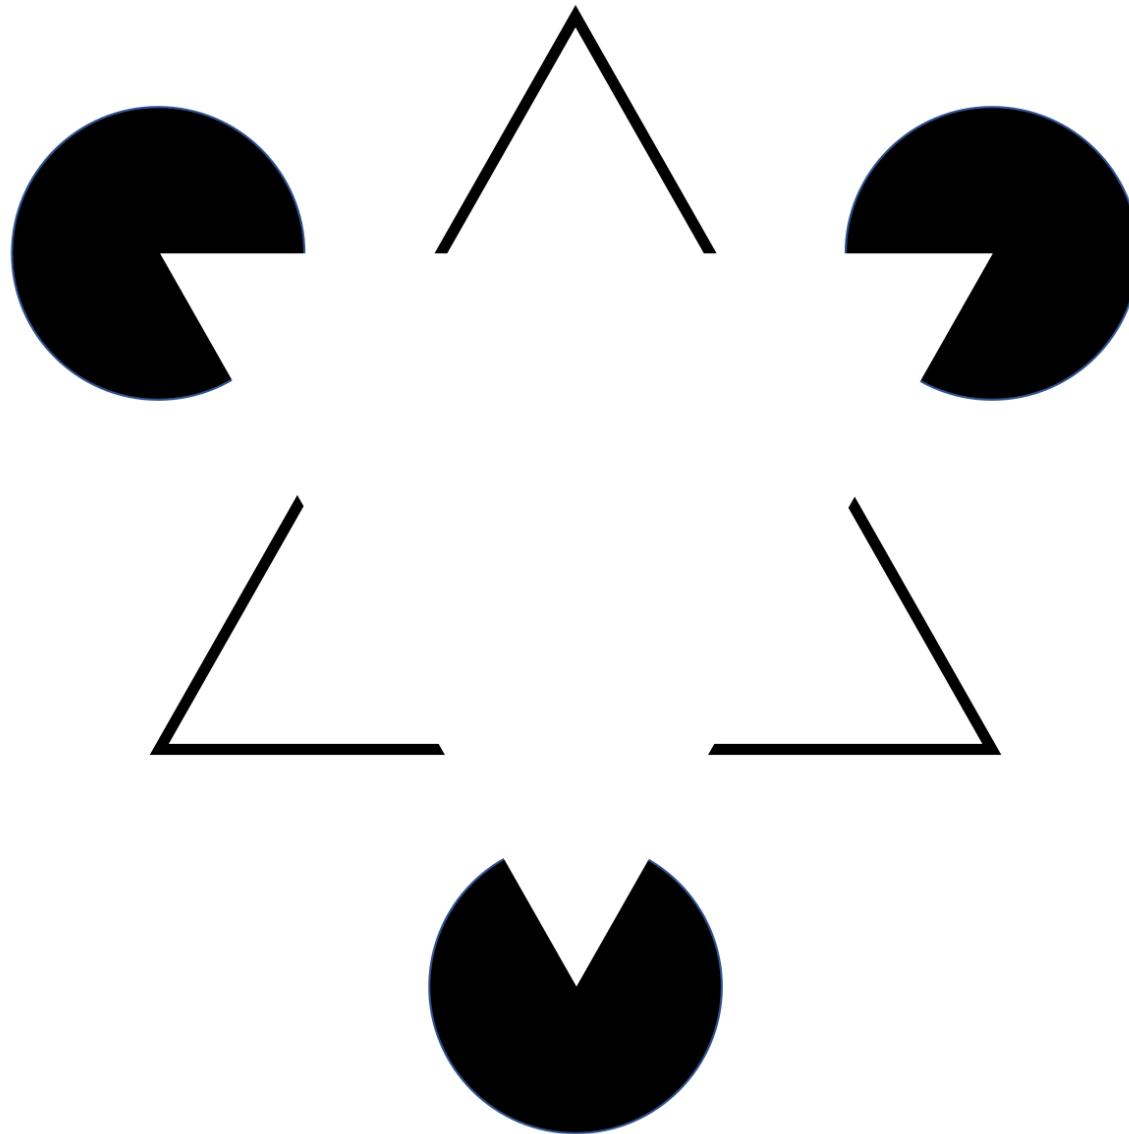

How many legs?

There's light blue
circle (with blue
stripes)?
Is it true?
Is there a circle?

There is no triangle there!
(Principle of enclosure)

3/30/2020

Neuron inhibition.

Fix the image for twenty
second and then look at a
white wall.
